News Desk

Vlc add-on causing concern

SOFTSWITCH is a new add-on for the Vic20 causing concern to software manufacturers, because it allows 'secured' Rom software packages to be broken into and saved on to tape.

Software houses have condemned the sale of the £19.95 add-on by the Swindon-based General Hardware Company, claiming that it opens the way for the easy piracy of cartridge software.

Although the unit only works with the Vic20 at the moment, its implications are more far-reaching. Many manufacturers are looking increasingly towards Rom software to avoid precisely the same sort of piracy problems, now commonplace for cassette software.

Softswitch is a small unit which plugs into the cartridge port on the Vic20. A games Rom can then be plugged into a port at its back. Softswitch then inhibits the auto-start of

No more ZX81 titles at Smiths!

WH SMITH is to stop taking new ZX81 software titles.

A spokeswoman for the company commented: "The reason is simply that consumer demand for the ZX81 has lessened."

"The ZX81 has been around for a long time and the Spectrum machine offers many more facilities."

WH Smith will however, carry on selling the ZX81:

"We cannot forecast what future demand for the machine will be, but at present we will continue to sell it and support it with our main lines of software."

A spokesman for Sinclair Research would not confirm that his company had been aware of the WH Smith move, but he said that no ZX81 hardware or software orders

How to submit articles

Articles which are submitted for publication
should not be more than 3,000 words long. The
articles, and any accompanying programs,
should be original. It is breaking the law of
copyright to copy programs out of other maga-
zines and submit them here — so please do not
be tempted.

All submissions should be typed and a double
space should be left between each line. Please
leave wide margins.

Programs should, whenever possible, be
computer printed.

We cannot guarantee to return every submit-
ted article or program, so please keep a copy. If
you want to have your program returned you
must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any
responsibility for any errors in programs we
publish, although we will always try our best to
make sure programs work.

Editorial

Computer crime is gaining in popular-
ity. Modern-day 'Robin Hoods' are
finding more and more ways to steal
from the computer and give to the
programmer.

The local government audit in-
spectorate published a survey of com-
puter crime in the UK in 1981. Of the
320 odd companies taking part in the
survey, only one in five admitted to
being the victims of computer crime.
Losses were estimated at £1m over
the previous five years.

Unofficial estimates, however, place
this figure much higher. In the US,
computer fraud may be running as
high as \$3,000m a year.

Computer crime also enjoys a cur-
ious kind of status. The programmer
who succeeds in persuading a bank
computer to credit him with £12m is
regarded in a very different light from
someone who holds up that self-same
bank armed with a sawn-off shotgun.

The psychology of the computer
criminal is also different from that of
his more mundane counterpart. The
challenge of 'beating the system' is
often more important than any monet-
ary gain.

In a world that is becoming in-
creasingly dominated by computers,
the opportunities for computer crime
are growing at an alarming rate. There
are, as yet, few safeguards to prevent
the computer criminal from practising
his art.

Next Thursday

Find out if you can move up along the
conveyor belt, through the holes to the
computers in Belt Man, next week's
Star Game for the Spectrum — a dyna-
mic 3-D adventure game.

Vic add-on

Continued from page 1

the game, by relocating the expansion Rom to a different area of the Vic20's memory map under software control.

With the auto-run disabled, software in the Softswitch program allows the cartridge program to be copied either to cassette or disc.

To run a program taken from Rom in this way, the Softswitch unit is again used, this time with an 8K or 16K Ram expansion unit used in place of the cartridge, and the program is simply loaded into Ram from cassette or disc.

Commodore's UK software manager Gail Wellington was not at all pleased to hear of the Softswitch development: "Certainly I will take legal action against anyone selling pirated copies of one of our programs, but to take action against individual users making copies for their friends is much more difficult.

"The sad thing is that the only people who will lose out with things like this will be individual software authors — we will have to take increasingly more complicated steps to protect our software and that, inevitably, will mean

smaller royalties for authors. It will mean in future we may be looking at only doing our own software — rather than taking any third-party material.

"I can make it impossible for our future software on Rom to be pirated in this way — what we will have to do is make the program write all over itself when it is run. That is fine for a Rom — it wouldn't have any effect. If the program was a pirated Rom, soft-loaded back into Ram, then the program wouldn't work — and somebody would have to do quite a bit of sorting out before it ever would.

"That obviously doesn't help with our existing Vic20 software, but our Commodore 64 Roms are already protected in this way — mainly because

piracy was seen as easier: on the 64 there is Ram-backed Rom."

Other manufacturers of Rom software for the Vic20 are also concerned by Softswitch.

Audiogenic's David Smithson commented: "With software piracy becoming prevalent, software houses will begin to lose money and software of reasonable quality will stop being written because it will no longer be worthwhile. Authors might as well go and become postmen — and earn more money."

Thorn EMI sells Rom software for the Vic20 and Atari machines. Hardware manager Peter Chandler said: "We are quite shocked. It is inevitable that people will bring these things out — it is very like a thing called *Mycard* manufactured in Taiwan for the Atari VCS.

"All our software is protected against this kind of thing — it will not work straight away and the pirate will have to do quite a bit of work on the program to run it. Hopefully, we have been devious enough, because the law gives us no protection."

Julian becomes the video king

EIGHTEEN year old Julian Rignall has become the 1983 Video Arcade Game Champion.

Julian successfully fought off competition from over 500 of the country's top arcade players to win the title. The best 18 met for the final held in London last Thursday. Julian received a prize of his own arcade machine, worth over £1,500, presented by the sponsors of the competition, UK arcade machine manufacturer, Taitel.

For the last three-and-a-half months aspiring video games whizz kids have been sending in their highest scores on any of six coin-operated games machines — *Donkey Kong*, *Donkey Kong Jr.*, *Mr Do*, *Robotron*, *Amidar* and *Defender*.

The three highest scorers from each machine were then brought together by the competition organisers, *Computer and Video Games* magazine. The six best players — one

from each machine — then played off on a new machine none of them had seen — Taitel's *Gyruss*, unveiled for the first time at the final.

Julian achieved his title with a score of 73,100. He won through to the final with a *Defender* score of 5,248,520 on a machine on the Royal Pier, Aberystwyth. From Tregaron in Dyfed, he is currently taking his 'A' levels prior to studying graphic design at Brighton College.

Close runner-up in the competition was David Ross, 15, from the Isle of Wight with a score on *Gyruss* of 72,350.

Prices slashed on Oric

ORIC has announced substantial price reductions on its 16K and 48K machines.

The 48K comes down by £30 to £139.95 and the 16K returns, after a brief spell at £129.95, to its original launch price of £99.95.

This brings Oric prices into line with those of its nearest competitor, the Sinclair Spectrum. Following recent Sinclair cost cutting, the 48K Spectrum was being offered at the same price as the 16K Oric. Now the rival 16K machines are matched price for price, but the 48K Oric remains £10 more expensive than its Sinclair competitor.

The new Oric prices take effect as from July 6.

As an additional bonus, new Oric owners will soon be offered a voucher with their purchase giving them £40 off the cost of the Oric MCP40 four-colour printer/plotter currently selling for £169.95. This offer will take effect "as soon as we can print the vouchers" according to Oric's sales director Peter Harding.

Unexciting trade show

MICROTRADE '83, Britain's first show exclusively for manufacturers and dealers, was rather a let down.

Free exhibitors attended the three-day event at the Barbican last week and even fewer had anything new to offer. The 55 exhibitors included only 15 or so of interest to the home computer user. Four manufacturers were there — Jupiter, Computers, Video Technology and Oric — with Sinclair, Commodore, Texas and Atari all staying away. On the software side only Microdeal, Imagine, Prism (distributors of Sinclair titles) and Melbourne House showed.

Interesting bits and pieces included: Jupiter's 16+ Ace in a better case at £10 extra (£99.95), Melbourne House's *Terror-Daktal 4D* game, a preview of Computers' first business software for the Lynx and a new company, Computer Software Associates, with a range of home business packages for the Commodore 64.

ZX81

Continued from page 1

had been received from the retailer for at least a couple of months. "There has been a drop in ZX81 sales over the last six months and the price drop from £49.95 to £39.95 was designed to keep the machine going," he said.

"The ZX81 is now not selling in anything like the quantities of the Spectrum, but certainly enough to justify it remaining in production."

● Prism, who handled distribution of Sinclair hardware and software to all but the very large retailers, was not aware of Smith's move. Prism managing director Bob Denton commented: "It does not surprise me. WH Smith has been doing some very strange things with the ZX81 recently."

"As far as Prism is concerned, ZX81 software is still very buoyant — we have just introduced some new titles. The hardware, however, has slackened off considerably."

"I expect that by October we will find some product shortages."

UNIQUE OPPORTUNITY!

BE A SOFTWARE EDITOR

McGraw-Hill is a billion dollar world leader in information technology. In 1982 alone, we invested 42 million dollars to continue our already considerable growth rates. A significant part of this investment went into further developing an extensive range of Software products.

To consolidate our success, we now wish to appoint a dynamic "self-starter", to edit and publish software in the educational, business and personal computing markets.

This is a challenging and rewarding post requiring a high standard of education with the ability to research and identify publishing opportunities in the above areas. In addition, a good knowledge of BASIC is required, along with familiarity with as many of the current micros as possible.

There is an excellent commencing salary. Company car and benefits package for the right applicant. If you are interested in joining one of the world's most prestigious companies, please contact:

Paul Jenkinson
UK and European Personnel Director
McGraw-Hill House
Shoppenhangers Road

Flying backwards

I think I may have found a major bug in Psion's *Flight Simulation* for the 48K Spectrum.

I set course for Lake Long from the SW corner of the map, intending to have a look at it from a great height. At 20,000 ft I dived for a low-level pass over the lake, but at 5,000 ft I had left it too late to pull out of the dive. I opted for a downward loop instead, not expecting to complete this manoeuvre. But luck was with me and I emerged in level flight with a view of Lake Long. This was the first time I managed this loop.

But, I was flying backwards! There was no doubt about it, Lake Long was receding in the distance. No, I don't think I was suffering from pilot disorientation!

To complete this unusual flight, I set course for Main East to see if I could land backwards on instruments and a rear view. Needless to say, I did not manage it!

By the way, my height record is 23,000 ft.

G D Davies
25 Hart Drive
Sutton Coldfield
W Midlands B73 5RU

Flying backwards?! I do not know about pilot disorientation, but I should think the passengers and crew were somewhat taken aback.

NB: Has anyone ever thought of including a parachute landing routine for pilots who decide to bale out?

Another bug

Further to my recent letter, which you were kind enough to publish (PCW 23-29 June), relating to a bug in *The Pit* adventure program, I'm afraid I have discovered another quite important bug.

The problem lies in line 2800, statement 2: $Let z = 1 + Int(Rnd * 3)$ leads to a random number between 1 and 3 inclusive. However, the program requires a number between 1 and 4, and the result is that it is impossible to enter level 4 as it stands.

The same problem applies

to the other statements in this line, which should be, respectively, *20 and *10. However, this is less important in that as things are, the timewarp destination is never on the right hand edge or the bottom line of the grid.

The matter is explained on page 73 of the Spectrum Manual.

Michael Kirkland
20 Batey Avenue
Rainhill
Prescot
Merseyside L35 8LT

On to a loser!

If any lucky *Penetrator* owners are growing old watching the handwriting which appears every time you start a new game, just press the A and Enter keys simultaneously — all the writing will appear at once.

PS: Please, please, get rid of 'Losers', it is the only part of your magazine which is totally unreadable.

Craig Mitchell (11)
28 Kirkstall Road
Hollin
Middleton
Greater Manchester M24 3EU

We in the office are all quite fond of *Losers*, but I suppose you cannot please all the people all of the time. It's funny, though, how our cartoons always seem to arouse such passions, be they for or against. Remember Arthur and Citizen Pain?

Great minds . . .

With reference to the very interesting feature about John Ritman and his *3D Combat Zone* program in the 23-29 June issue, I would like to think that "Great minds think alike" — since the principles and theory which he describes are almost identical to those which we employ in our *3D Graphics* program.

This program is a general purpose Computer Design Aid which enables users to design any 'wire-frame' figure — just as John Ritman does in *3D Combat* for his pyramids and tanks — and then rotate these about any axis to obtain differing views in full perspective.

For anyone who is in-

terested in the theory, our program can be examined and even altered to your own requirements. Routines for design, rotation, perspective, display, enlargement, etc, are all provided — and even an 'action replay' facility which uses a multiple screen concept very similar to John's.

The latest facility which we have provided is an interface to the RD Labs Digital Tracer and to the DK Tronics Light Pen. Both of these can now be used to design objects directly — without the need for complex mathematics.

Just for the record, I find *Popular Computing Weekly* top value in providing a balanced diet rather than regurgitated reviews — keep it up.

Incompatible portable

After many months of monopolising the only colour TV set (a 22-inch Philips) in our house with my Spectrum, I decided to buy a 14-inch colour portable. Off I went to Dixons in Hounslow High Street, and returned with a Hitachi remote control 14-inch set.

The picture was excellent and I was very pleased with it, until I plugged in the computer. I was rewarded by a good picture, but only in black and white! I then phoned Sinclair Research, who told me that they had heard of the problem before and that the tuning on the Hitachi was not fine enough for the Spectrum. Sinclair advised me to avoid Hitachi, Grundig and Toshiba televisions for this reason.

I returned to Dixons, armed with the Hitachi and my Spectrum. They were very helpful and understanding, and let me test my computer on a Sony Trinitron in the shop, which worked perfectly. I was able to change the Hitachi for the Sony. My thanks go to Dixons for their patience and help.

Fellow Spectrum users, therefore, should beware of Hitachi, Grundig and Toshiba, when buying portable TVs, for although they are good sets, they are likely to be incom-

patible with the Spectrum. I do not know if other computers suffer the same problems with these sets.

Middlesex

Children only

With reference to your article on the Computer Fair at Earl's Court (PCW 23-29 June) I totally agree with you. I found some of the displays interesting, but they couldn't hold my attention for long.

I went by coach to London with my father, and he thought it was a let-down as well. When there is another fair next year, there should be a special day only for children. When we went to any of the displays, we couldn't get close because of the number of children that were there.

I hope there will be a better showing next year.

Christopher Hazell
23 Woodview Rise
Strood
Rochester
Kent ME2 3RP

Now that is an interesting idea — I have heard of trade-only days for fairs, but never children-only days. What do the rest of our readers think . . . ?

Where's No 25?

Is there a mistake in your numbering system, do you have a grudge against No 25 or do you like No 24 so much you wanted to print it twice? I am willing to pay a considerable sum for PCW No 25 (Vol 2) if anybody can supply a copy.

Please publish more software for that machine among machines, the Commodore 64.

Gary Foreman
81 Hazelton Road
Colchester
Essex

Er . . . well . . . to be honest, we made a mistake. But, if you look at page three of Vol 2 No 24 (second edition), you will see that we printed the correct number inside.

As for your desire for more software for the Commodore 64, see the Star Game in our July 14 issue (Vol 2 No . . .).

DOTMAN

Ghosts chase you as you try to eat the dots and collect points. You can turn the tables on them by eating the gels. Don't forget the ghosts have been given intelligence and will try to corner you. This feature makes Dotman exciting and challenging. An M.C. game complete with running and highest scores and tunnels.

JS/KB VIC 20 Unexp. £5.95

3D TIME TREK

At last a 3D game for the VIC. Although badly wounded, you are determined to seek and destroy the marauding space pirates who have now dispersed around the galaxy in search of fresh prey. A brilliant Star Trek game with a difference — spectacular 3D graphics and real arcade actions.

JS VIC 20 16K £5.95
JS COMMODORE 64 £5.95

ZOK'S KINGDOM

Your starship badly damaged in a meteor storm, is forced to crash land on the planet ruled by ZOK, a time space generated image of Dracula. You are challenged to a battle of wit and endurance as the battle for survival starts in earnest. In this big multi-screen graphical adventure in hi-res graphics and M.C. movements.

KB/JS VIC 20 16K £5.95

GALACTIC ABDUCTORS

A stunning action-packed game which uses all of your TV screen for the superb large animated graphics. Giant Space Hawks whirl and weave in intricate patterns, as they drop their deadly humming mines which will destroy your base on contact. While you are busy defending yourself, the Hawks will feed on your helpless populations returning only their skulls. All M.C. game complete with high score table that will blow your mind with its graphics and sound effects.

JS VIC 20 16K £7.90

SLAP DAB

An exciting game based on the arcade game PAINTER, which combines fast action with strategy. Giant insects hiding under the old paint surface are released by your paint brush. You require fast action and quick thinking to outwit them and finish the panel. The game is 100 per cent machine code and hi-res graphics also includes hi-score and running score with brilliant sound effects.

Bomber Run

A game for the Commodore 64 by Les Allan

Bomber Run for the Commodore 64 utilises hi-resolution graphics to construct a random cityscape, and sprites to control the position of the plane and bomb.

The program gives the following options:

1. joystick (port 2) or keyboard
2. skill level (1-5)
3. plane speed (fast-slow)

As the plane flies back and forth across the sky your bombs must destroy the city to enable the plane to land, refuel and embark on another mission.

After each successful landing your flight path is lowered. However, after five successful landings your original flight path is restored and, when applicable, your skill level is automatically increased.

A score table routine is provided which lists the top 10 names against their scores. During this sequence the following options are available:

1. fire button (space bar) — return to game
2. F1 — change skill level
3. F7 — quit game

NB. Program should be saved prior to running as pressing F7 activates re-set mode (SYS 64738). The program also self runs after 30 seconds.

Data is held in the following areas of memory:

12288-12607 — sprite graphics
14336-15359 — keyboard characters
15360-15407 — hi-res graphics

The REM statements in the program should reveal its working, but just in case here is a brief listing.

0 clear screen: dimension arrays
2 label sound generator
4 set and clear variables
8-12 set strings for city build
14 set game

15 title page and instruction routine
16-24 set screen
26-34 set sprite co-ordinates
36-44 control sprite
46 print score
48 check for collision
50-51 advance bomb pointer
52 fire button (space bar) ??
54 drop bomb and demolish building
95 delay to keep speed constant
58 check for plane landing
60 move plane
62-66 landing sequence
70-80 take off routine
82 lower flight path
86-106 print bonus point and pause play
500-510 bomb x,y: determine bomb strength

600-620 check bomb building contact
 H = (1064 + (B - 16) * 8 + (BY - 45) * 5)
 converts sprite to screen
 700-726 crash sequence
 800-804 skill level change
 1000-1044 set up initial options
 2000-2036 title page
 3000-3020 instructions (graphics in line 4004 are
 shifted YOU ARE THE PILOT OF A
 FIGHTER PLANE)
 5000-5080 score table routine
 5500-5590 data

Please note that standard abbreviations
 for basic keywords must be used in order
 to satisfy some line lengths. These appear
 on pages 130 and 131 in the User Manual.

NOTES

- 64th byte is read but not used for sprite generation
- pointer for protected memory is memory start/256
 ie, poke 52,12288/256
- x co-ordinate of sprite (n) controlled thus:
 10 for x = 0 to 343

20 poke VC+2,x and 255
 30 poke VC+3,y
 40 poke VC+16,int(x/256)+n
 50 poke VX+21,n
 60 next

4. Video Chip Register

VC — start address (53248)
 VC+2 — sprite 1 x
 VC+3 — sprite 1 y
 VC+4 — sprite 2 x
 VC+5 — sprite 2 y
 VC+17 — screen on/off
 VC+23 — y expand
 VC+27 — b'ground/sprite priority
 VC+29 — x expand
 VC+31 — sprite/character collision
 VC+32 — border colour
 VC+33 — screen colour
 VC+40 — sprite 1 colour
 VC+41 — sprite 2 colour

5. Main variables

A — read data
 B — bomb x (0-343)
 D — bomb damage
 G — 1st game

H — sprite/character conversion
 I — data pointer
 X — plane x
 Y — plane y
 AT — attack/decay
 BP — bonus points
 BS — bomb start
 BX — bomb x (0-255/083)
 BY — bomb y
 DX — plane movement
 HI — high frequency
 HS — high score
 KEY — joystick/keyboard address
 LO — low frequency
 PX — plane x (start)
 PY — plane y (start)
 SB — flash routine
 SC — current score
 SS — self start
 SU — sustain/release
 VC — video chip
 VO — volume
 WA — waveform
 SC(X) — score table (score)
 SC\$(X) — score table (name)

for LYNX, DRAGON, SPECTRUM
and ZX81 Software

SULTAN'S MAZE by Christopher Hunt. Enter the 3D Maze in search of the Sultan's jewels, but beware, your strength may run out, or, you may come face to face with the Mad Guardian. A multi-difficulty game with fantastic graphics and sound. Price (LYNX & DRAGON) £7.95.

MONSTER MINE by W. E. MacGowan. Escape from the mine with as much money as you can, but don't get closed in or caught by the prowling monsters. An addictive machine code game, with superb graphics and save facility. Price (LYNX & DRAGON) £7.95. Price (SPECTRUM & ZX81) £4.95.

GOLF by Pete Allen. An excellent Basic program, giving you an 18-hole course, with handicaps and choice of clubs. A golfing weakness must be specified. Amazing graphics and sound!! Price (LYNX & DRAGON) £7.95.

GAMES PACK III by Christopher Hunt.

CHATEAU by Pete Allen. A new type adventure, in which you must wander the Count's old mansion in search of treasure! Of course, when the Count hid his treasure, then died, he left lots of unpleasant surprises for those brave enough to try and seek out his riches!! Come face to face with Ghouls and Ghosts, Vampires and Trolls; do you run or fight? Will the mysterious Travel Agent suddenly appear and whisk you away to far off places? Where can you find the key or the lamp? Is the clock booty-trapped? Will you die a cold and lonely death, or will you win through to claim the fantastic treasures of The Chateau? Price (DRAGON) £7.95.

REVERSI. Pit your wits against the Lynx with this easy to learn, yet extremely demanding board game. Five skill levels, from novice to grand master.

SNAKE. Guide the snake to the food, but watch out, he will grow and must not eat the wall or himself.

PONTOON. An excellent implementation of a favourite card game in full colour with sound. Lynx is a mean Barker. Price (LYNX) £7.95.

GEMPACK IV by W. E. MacGowan. Two great machine code games, with full colour graphics. In Sea Harrier you must land your plane on the aircraft carrier, after dispersing the clouds with chemical bombs, but don't hit the ship! In Sub Chase you must depth charge the wolf pack without being sunk. Both with four levels of play from easy to kamikaze! Price (LYNX & DRAGON) £7.95.

Reinforced high impact body.

Specially formulated, non-stretch,
high tensile polyester base

Asicular longitudinally
orientated particles

Close tolerance rollers for accurate
tape tracking.

Long life silicone
lubricated axle pins

Mu-metal shield.

Low static leader.

Low friction, anti static, corrugated 1
slip pads, graphited for low friction n
winding.

Reinforcing ribs plus tongue and
groove interlock

Tape guide for minimum tape wear,
low torque and low error rate.

Mounted pressure pad.

For some time a specially formulated professional quality data tape has been available to software producers and duplicators. This high quality tape has been specially formulated for micro based data storage systems. With the rapid growth of home computers and the unsuitability of most audio tapes used in short lengths, it has been decided to make this tape available to the general public under the name of PIRANHA.

The PIRANHA computer tape will soon be obtainable through selected retail outlets, but to give you a taste of the PIRANHA's astonishing data performance we are launching a short mail order campaign in the leading Micro magazines where we are offering a limited number of PIRANHA computer cassettes at an amazing price.

Mike Grace looks behind the covers of another range of

Vic20 software

It seemed to me that, with the passage of time and the increasing number of competitors entering the software scene for the Vic20, the quality of the games market should be on the increase. Indeed, the professionalism of many of the cassette covers helped to create this myth in my mind, for many of the companies have invested in artists, colour printing, and generally improving the overall eye-catching presentation that I personally feel to be very important. And, I would like it to be noted, that when I say important I am not talking about selling the product (though needless to say this is rather important to the software company), but rather from the overall feel that you have bought something that is nice and at least worth what you spent.

So, imagine my surprise on receiving the latest batch of goodies from the editor to discover that I have been both right — and wrong. I had been right in that the covers were indeed improved almost beyond recognition (gone are the days, it seems, of the hastily scrawled sketch of an alien on a mystic horse or whatever), to be replaced more and more by jazzy and highly artistic space or fantasy scenes. But, I was also wrong, in that the first three games I tried out were so poor by comparison with many I've been reviewing of late that I found it incredible they had been marketed at all. Of course, many people may buy these cassettes on the strength of

the covers (let's face it, unless you are at an exhibition it can be difficult to try out a prospective game), but, like many a paperback, it's extremely dangerous in the software world to judge a game by its cassette cover.

But, let's be a little more specific. Lyver-

soft of Liverpool provided me with two cassettes, both of which demonstrate exactly what I'm talking about. In neither case were there any instructions with the games, except the simple comment "To load type LOAD".

The first game I loaded was *Lunar Rescue* which seemed to be *Frogger* in outer space, and consisted of a mother ship (the equivalent of home) at the top of the screen and three little astronauts at the bottom. Between the astronauts are a stream of continuously moving meteorites (like the cars in the road in *Frogger*) and your mission (should you decide to accept it!) is to pilot a spacecraft between the meteorites, pick up an astronaut, and then pilot your way safely back to the ship.

Detonated by a passing meteorite

The game is very slow and relies on the keys Z and M to move the ship left or right as, once started, your craft will automatically either move up or down the screen, depending on which way you're going at the time. Unfortunately, besides being slow, I found quite often the keys failed to work which meant I was detonated by a passing meteorite most unfairly. I found the game exceedingly boring and gave up playing after about 10 minutes. After all, when you cannot win because the computer doesn't respond to your instructions and the keys don't work — it's not really worth it, is it?

The second cassette has the same lurid cover (this time obviously drawn by someone who couldn't have any idea what the games are about as the picture of one of the games, *Crazy Climber*, shows a savage battling red balloons and giant snakes in a jungle, whilst the game is about a man running up and down ladders on scaffolding in the style of *Krazy Kong* picking up flags). The two games are *Apple Bug* and *Crazy Climber*. The latter is as I've described, with you as a little man running against the clock to collect flags to score points. Every now and then a piece of masonry (I assume) drops inexplicably from above and knocks a flag off before you can get to it, thereby reducing your chance of a high score. You have one minute to collect the flags, then *Time's Up* appears in the middle of the screen and your score is displayed.

The other game, *Apple Bug*, suffers from a mysterious fault where a snake (your enemy) can move much faster than you can. So, whilst your goal is to eat apples in a maze (*Pacman* style), I found I never managed to eat more than one as the snake always got me. One problem was that the keys I pressed to move me

seemed to be much slower-acting.

Looking at all three games together, I'm amazed that they've been presented in such a poor form. No attempt has been made to add interest to the graphics, or even the instructions at the start. The use of a joystick these days would seem to be mandatory, yet none of them offer this facility. Written in Basic (I assume), they suffer from slow action. And, perhaps worst of all, they seem to me to be poor imitations of other games. Priced at £6 a cassette, I fail to see any reason for even considering purchase of either cassette in view of some of the other software around in the same price range.

Rabbit Software is another company which has taken recently to packaging its wares in large boxes containing the cassette inside (similar to Commodore's approach). This is a neat trick, as it makes you think (irrationally) that you're getting more for your money, especially as most people probably do as I do and throw the box away on reaching home. However, it does make the initial purchase look more attractive, so as these cost a little more than the average game (£10 a tape) let's see if they give better value.

I had two games to review, both needing extra expansion (8K or over). The first of these was *Cylons*. On loading, the screen goes black and gives you the option of Beginner/Intermediate/Advanced/Expert (by pressing F1), the option of a fast start or not (by pressing F2), and whether you want to have Ricochet and/or Terrain by pressing F3 and F4. This seemed a little strange on first playing (after all, I didn't even know what half the options meant yet), but I keyed in what seemed to be the safest thing and off we went.

Cylons is really another version of *Asteroids*, with your spaceship resembling a pawn piece out of a chess set and the asteroids being little red whirly-gigs that chase and fire at you with the same degree of skill you'd expect from alien baddies. By pressing C at the end of a game you get the options back and have the opportunity of changing. Terrain adds a very basic landscape of mountains to the bottom of

the screen and, if you crash into a mountain, you blow up. Ricochet means that either your ship or your bullets hit the side-walls of the screen and bounce back again. Adding a higher skill level increases both the speed and the variety of the baddies (as we'd expect).

I felt this game was not really worth the extra money and, although I'm not a lover of this type of game, I also tried it out on a number of children, all of whom gave it the thumbs down.

However, the second game from Rabbit, a strangely-sounding thing called *Critters*, started to relieve our depression at this batch of software a little. In *Critters*, you are a stick man who needs to protect a line of apples lying on the ground (the bottom of the screen) from wave after wave of 'vultures' who seem intent on grabbing your apples (I must confess that I was not sent the instructions for either of the Rabbit games and, as none are included in the game itself, I may be missing some vital aspect or doing Rabbit a slight disservice with my own attempts to play, but having said that let's get back to the action).

The graphics are definitely better in *Critters* than in *Cylons* and the vultures look quite realistic. They tend to swoop down on you with sudden and dramatic speed, and your little man jumps about and fires quite realistically as well. Once a vulture is hit, he turns black and is of no more concern. However, I found it quite hard to control my stick man with the agility I would have liked, so it seemed that a vulture could slip in under my guard and swipe an apple every now and then, and I couldn't stop him. Once all five apples have gone, the game is over.

An early solo venture

At £10 for each cassette I did feel both are overpriced. And, although the idea behind *Critters* was a little better than the others I'd tried so far, I still felt much of the originality I've been seeing from people like Llamasoft and Anirog in the past was missing.

Hopefully, I turned to *Xerus* from Electronic Leisure and loaded it in. Again no real instructions with the game, but Electronic Leisure enclose a printed page from a dot-matrix printer (looks like the Vic1515) and that, coupled with the slightly amateurish artwork on the cover, lead me to suspect that Anton Hinxman (the author) may well be running this company as an early solo venture. But, my speculations were soon forgotten as soon as the game loaded.

Instructions appeared, neatly presented and with both joystick and keys explained, then we were off. It is another game where you patrol along the bottom of the screen, firing rapidly as you go (I found it best just to keep my finger on the firing button all the time) and the alien baddies drop down on you and try to zap you away. Movement is fast, the graphics are good (the aliens look

a little like a bull's head with horns) and the score is displayed neatly along the bottom of the screen. I found it relatively easy to hold my own and not be blasted to bits as soon as the aliens appeared (a problem I occasionally have with some games), but as each game ended (you have the usual three lives) I found my score annoyingly well below the 'top score 5000' remark which appears as soon as you finish any game. Perhaps, if you aspire to the heights of a top score, you get a bigger gun (as in *Abductor* by Llamasoft) or perhaps you just get faster and meaner baddies — I don't know yet and from the way I'm going it'll be quite a while before I do — but I liked the game.

Sumlock Electronic Services is a company which has produced efficient and attractive covers for its cassettes. *Skramble* (for the unexpanded Vic at around £8) certainly looks good at first sight, with neat typed instructions, lurid views of a space battle on the front and, on loading, a mixture of flashing screens and a 'theme' tune which sounded very like the theme from Superman. Regrettably, the game proved to be a disappointment, for the

graphics are rather amateurish, the speed slowish and, compared with other games at less price, it does seem not much care has gone into presentation. The game is simply another spaceship flying along, firing at aliens ahead or dropping bombs on the enemy bases, whilst beneath the slightly irregular landscape moves along.

To give the game its due, there are several levels, so that if you survive the first wave you get an impenetrable wall of fireballs to manoeuvre through, then it starts to get faster. The time allowed depends on the amount of fuel you have, and to refuel all you have to do is destroy enemy fuel tanks (represented by red or black splotches on the ground, I wasn't sure which). But, again, a little more imagination could have been used.

In fact, *Skramble* brought up several points that I think distinguish a good game from just a mediocre one. Firstly, there is a distinct lack of guidance for the player as to what the screen display is doing whilst you are playing — for example, a white bar starts to move along on the top of the screen as you start, but is this time running out, your fuel, or what? This bar is quite mysterious, as if you do survive until it runs out then instead of a bar a number of mysterious graphic symbols appear (which could be the shape of the alien ship, base, or whatever you have just hit).

The second point is that an irritating tune plays all the time you are engaged in battle, and you can't really turn the sound down as then you lose the satisfying sound effects of your cannons firing and your bombs destroying all alien life! It should be possible to play without a musical background, but retaining the delicious zaps and booms.

Other points are the obvious lack of

REVIEWS

imagination used in graphics and colour, the incredible feat of having to play with joystick and keyboard (you have to press the spacebar to drop bombs and the firing button to fire your cannon, preferably simultaneously), the lack of care taken in presenting instructions to the user (I think even I could have improved on the screen display for using keys or joystick) and other little points that help make a game just that little better. It may sound like I'm picking on *Skramble* — I'm not. I'm just using it as an example of a general problem in Vic software.

Skyhawk is a game from Quicksilver (the ones with the splendid full colour adverts in the computer magazines), with another impressive cover of a sleek jet streaking towards us and the rolling English countryside below. Inside the cassette cover is a storyline, giving us a little background to the plot of the tape (it appears that mysterious raiders are bombing a quiet European village to destruction until a mysterious stranger comes to their aid and, at the cockpit of his jet, he patrols the skies above the village, waiting to zap the baddies from the sky).

On loading, a most impressive scene appears of buildings in a green countryside — the graphics department has gone to town with very realistic three-dimensional houses and blocks of offices.

Below this scene are three small displays, one for fuel, one for score, and one which is an overall radar screen giving you an idea of where the invaders are, so that you can fly your jet in the appropriate direction. And even your ship looks better than many I've seen in the preceding games.

Style and presentation

In fact, this game isn't any different from *Skramble* in concept — all you do is fly along, firing at the baddies when they appear — but the care and thought which has gone into presentation, plus the superior sound effects and incredible graphics, make it a thousand times more enjoyable to play. In some ways it's the little things that make the real difference (like the fact that a blip warns you when fuel is low and you have to hover over a fuel pad to get restocked) and, as *Skyhawk* costs the same as *Skramble*, it isn't hard to know which one is worth the money (it costs £7.95 and needs an 8K or 3K expansion — make sure you get the right one).

The final game this time is *Xeno II* for the 16K Vic from Anirog Software and priced at £7.90. No flashy cover with my review copy, just a hastily prepared print-out on the 1515 to tell me what to do. But, I've been impressed with Anirog in the past, so I awaited this game with anticipation.

Being 16K, it takes an age to load, but it's well worth the wait. The screen is fully taken up with graphics and the sound effects are good, but it's the style and presentation that wins again. In this game you have four stages to manoeuvre through, starting with another version of *Frogger* in outer space in that you must pilot your spacecraft through the mass of meteorites (sound familiar?) to land safely on the planet's surface. Now, to accomplish this feat you need to apply thrust at the last minute, or else your ship just crashes into the surface. It was here that I began to suspect my joystick was not allowing me to get full value from this game (and possibly others I've reviewed, I must add), as I just could not stop from crashing into the surface no matter how hard I tried. Thus, I never made it to stages 2, 3 or 4.

So, to try and add an element of suspense to these reviews, I'll leave *Xeno II* until I have been able to acquire a better joystick.

To summarise, then, another collection of arcade games for the Vic with approximately the same price-tag, but vastly different in value for money and presentation. With so much software about, I think the best advice I can now give to Vic20 owners is — *don't buy without seeing the goods.*

A routine program

Bryan Skinner explains the advantages of building up your own library of subroutines

Although I have stressed the top-down approach to program design (*PCW*, 3-11 May), such a technique does have its disadvantages. Perhaps the most salient of these is that it provides poor detail as to exactly how the various routines required are to be performed.

This article should remedy that deficiency somewhat, as it will approach the problem from the other end. This implies that the best compromise one can make is to design a program from the top-down, but to construct it from the bottom-up.

Most professional programmers and serious hobbyists create for themselves over time a "library" of subroutines; short routines which are kept on disc or tape and which can be appended to the body of a program under development.

Many commercial programs consist of a single master program which calls up, or "chains", other minor programs called "overlays". One reason for this is that the main program itself may be so large that there would be no room in Ram for all the additional routines required. Overlays can be loaded into an area of Ram and run from the main program, rather like calling up a subroutine. When they have finished

their functions, control is returned to the master program.

Other systems allow subprograms to be "chained" to the main program by loading the sub-programs, passing variables to them and reloading the master program when they have finished.

The other reason for using such sub-programs or subroutines is that it saves having to rewrite often-used routines each time you want to use them. In this article I shall provide coding and examples of routines for the Dragon 32 which I have found to be of particular use.

I have already provided the "press space to continue" routine in a previous article (*PCW*, 23-29 June). A similar routine can be used when one wants to provide the user with the opportunity to check his input and retrace his steps when entering data. This takes the form shown in the flowchart in Figure 1.

This routine needs but two variables, *AS* (the user's input) and *RS* (whether or not to continue). The subroutine itself is represented by the three lines, *Clear Display*, *Display Input* and *Prompt — Accept/Reject*, and is coded as follows:

```
900 CLS
910 PRINT AS
920 PRINT
930 PRINT
940 PRINT "A=ACCEPT/R=REJECT"
950 RS=INKEYS: IF RS<>"R" AND RS<>"A"
    THEN GOTO 950
960 CLS
970 RETURN
```

To use the routine, we first set the user's input as *AS*, using a command such as *Input AS*, then call the subroutine which clears the display, displays the input and asks the user if they want to keep this value, or re-enter it. If they want to re-enter, when the subroutine *Returns* command to the calling routine, *RS* will be set to "R", so we can test for this and, if *RS* is *R*, repeat the input procedure.

As an example of the subroutine in use, the following should make things clear:

```
90 CLS
100 PRINT "ENTER ITEM TO SEARCH FOR";
110 INPUT AS
120 GOSUB 900
130 IF RS = "R" THEN GOTO 90
140 ... rest of program
```

It should be apparent that this fragment of code will cycle round lines 90-130 until the user makes an entry and responds *A* to the *Accept/Reject* prompt. Note too that the screen will not get cluttered with old entries, due to the *CLS* statements.

You will notice if you try this example that the screen display is still "messy". I firmly believe that you should control very carefully exactly where things appear on the screen. That is, you should never use the *Print* statement on its own — always use *Print@*. Similarly, avoid *Input "Prompt";AS*.

It is not always easy to do this, but the polished and professional appearance of your programs will be well worth the time spent getting things exactly right and will reflect your competence.

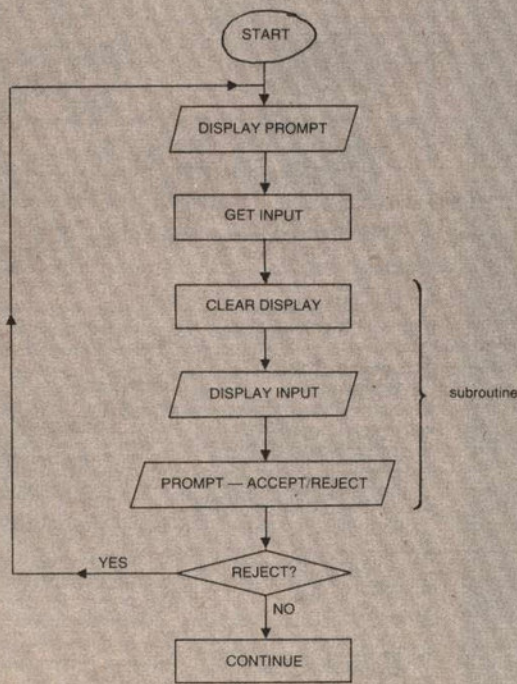

The *Print@* statement is very useful, but I have always found calculating the screen location for an item somewhat tedious. For this reason, I developed the next utility, which is not a subroutine but a device to make programming easier. The problem is how to calculate row and column — given that each row consists of 32 columns, the *Print@* positions for the first few lines are given by:

```
LINE 1 = 0
LINE 2 = 32
LINE 3 = 64
LINE 4 = 96
```

and so on. The easiest way to deal with this is to put these values (the "32 times table") into a numerical array, so that to *Print* on line 9, all you have to write is *Print@ L(9),AS*. Setting up the array can be done at the beginning of a program in a

Mike Hampson proudly presents the ONLY

SPECTRUM FORTH

WITH FLOATING-POINT

At last! An alternative language with program power! Programmers in their thousands are turning to FORTH as the number one alternative to BASIC and MACHINE CODE because of its incredible SPEED and SIMPLICITY, and now the first ZX Spectrum FORTH with floating-point arithmetic brings a new language with SPEED and POWER to the 48K Spectrum owner.

- * All trig functions in radians AND degrees
 - * Operation of ZX printer
 - * Full floating-point arithmetic
 - * Easily mixable integer option included
 - * Full global control of colour, sound and high-resolution graphics
 - * CIRCLE, DRAW, OVER etc
 - * BEEP (like BASIC) plus BLEEP, for machine-code-style sound effects
 - * Based on FORTH-79 (like the Jupiter Ace)
 - * Includes all FORTH structures, and recursion
 - * 190 predefined words
 - * 32K available to user
 - * Complete tutorial user manual.
 - * £2 off if you cut out and send this advertisement
- Order code FP50T Price £14.95

STILL AVAILABLE

The ONLY Spectrum FORTH at this UNBELIEVABLY low price. Powerful integer arithmetic, sound, graphics, colour, 256 UDGs, over 100 predefined words, 32K available to user, complete tutorial user manual.

FOR FIRST TIME USERS...

A new series of books which introduce newcomers to the most widely used micros in the marketplace.

The books assume absolutely no knowledge about computers and the reader is shown even the most fundamental operations such as "switching on" and "loading a program". The books lead the reader through simple programming and then onto graphics, with several programs which show how to achieve pictures and even animation. The books contain a number of specially written programs which show the full potential of these machines.

"The text is liberally supported by all manner of useful diagrams and illustrations (including many black and white photographs of the screen). The overall presentation is excellent. The printing, setting out and listings are clear and positively invite the reader to have a go."

PROGRAMMING

For... Next loop like this:

```
10 DIM L(16)
20 FOR I = 1 TO 16
30 L(I) = (I-1)*32
40 NEXT
```

To Print something starting from a certain column on a given line simply requires that you add the column number into the Print statement, eg:

```
PRINT@ L(5)+10,AS
```

This technique of accessing lines also allows you to use a subroutine to clear a group of lines. For example, if we want to clear lines 8-13 inclusive, without clearing the rest of the screen, we set two variables; eg *FI* (From Line) and *TI* (To Line), then pass these to a subroutine which is basically a For... Next loop which prints blank lines, thus:

```
300 FL = 8:TL = 13
310 GOSUB 1000
REST OF PROGRAM ...
```

```
(Subroutine)
1000 FOR CL = FL TO TL
1010 PRINT@ L(CL),""
1020 NEXT
1030 RETURN
```

The variable *CL* is the loop counter or index which I use here to stand for Clear Line. I often wish that the Dragon's implementation of Basic allowed longer variable names.

Another set of useful subroutines concerned with a screen display covers producing borders for text display screens. There are a number of methods of achieving this, but the fastest use *String\$* for the top and bottom lines, eg:

```
2000 REM TOP & BOTTOM OF BORDER
2010 CLS
2020 PRINT@ L(1),STRING$(32,42);
2030 PRINT@ L(16),STRING$(31,42);
2040 POKE 1535,106
2050 REM LEFT & RIGHT SIDES
2060 FOR SL = 1056 TO 1472 STEP 32
2070 POKE SL,106
2080 POKE SL+31,106
2090 NEXT
2100 RETURN
```

Some of this code will probably require explanation! Lines 2020 to 2040 print a line of 32 stars on the top and bottom lines of the screen. Notice that line 2030 actually prints 31 characters, the last character on the bottom line has to be Poked into the screen memory location to avoid a carriage return which would ruin the display. Notice too that printing a character needs a different number from Poking that character to the screen. You can, of course, alter the numbers used and there is no reason that the sides of your border should be the same as the top and bottom.

You will have to experiment to find the relationship between Printing a Chr\$ and Poking a screen address to match characters. The Ascii codes for the alphabet are the same, but other sym-

bols have different numbers.

Lines 2060 to 2090 deal with Poking the characters to the sides of the screen. Here we start at location 1056 (the first column of the second line) and go up to 1472 (the first column of line 15) in steps of 32; ie, line by line. Adding 31 to the loop index gives us the last column of the row for the right-hand border.

Having produced a border, we do not want to print over it. There are a number of ways round this. We could add 1 to each print statement, eg:

```
PRINT@ L(6)+1, "ENTER NUMBER";
```

in order that the statement be printed starting from the second column of line 6, so that it doesn't overwrite the border. (Notice the semi-colon which serves to suppress the otherwise automatic line feed and carriage return after a Print which in this case would overwrite the right-hand border!) Other methods of dealing with the problem would be to alter the original setting-up of the array *L*, ie, alter line 30 above to read:

```
30 L(I) = ((I-1)*32)+1
```

Alternatively, we could re-define the array in a For... Next loop viz:

```
1100 FOR I = 1 TO 16
1110 L(I) = L(I) + 1
1120 NEXT
```

Whichever method you use, there are still problems with using *Input*, since when the user presses Enter, a carriage return and line feed will be generated which will erase the character forming the right-hand border. The only ways of getting around this are either to keep track of exactly which line the *Input* is on, and then to Poke the border character back on-screen (which is not very satisfactory if the *Input* spans more than one line); to call up the right and left-hand border printing routines from the subroutine above by jumping into the routine at line 2060 after each *Input* (which may erase some of the *Input*) or to use *Inkey\$* and limit the user's *Input* in some way.

This brings me to my next routine which uses *Inkey\$* to simulate *Input*. The only drawback to this method is that the user cannot use the backspace key to delete a character that has been mis-typed. You might be able to alter the coding to achieve this, but things get a bit complicated as you are now working towards the level of screen dependent-cursor control, which is probably better dealt with in assembly code.

Nonetheless, this routine will allow the user to enter up to 60 digits. If the user enters a number that is greater than 10 or less than 1, an error message is displayed, the user prompted to press the space bar to continue and the process repeated until the user complies with the prompt. The routine needs the variable *Mc* to work

correctly — here *Mc* is set to 2 so that the user cannot enter more than two digits. It is fairly easy to modify so that one can restrict string entry to a given number of characters and prevent numbers from being *Input*.

The numerical entry routines are as follows:

```
500 CLS
510 PRINT@ L(5),"ENTER A NUMBER BETWEEN
1 AND 10";
520 MC = 2
530 GOSUB 1000
540 REM GET A 2 DIGIT NUMBER
550 NO = VAL (NO$)
560 IF NO<1 OR NO > 10 THEN PRINT@
L(15),"INVALID NUMBER, PLEASE RE-
ENTER":GOSUB 0000:PRINT@
L(15),"GOTO 500
570 ... REST OF PROGRAM ...
999 REM SUBROUTINE TO GET MC DIGITS,
RETURNS NOS
1000 NOS="" :TMS=""
1010 TMS = INKEY$:IF TMS="" THEN 1010
1020 TM = ASC(TMS):IF TM = 13 THEN RETURN
1030 IF TM < 48 OR TM > 64 THEN 1010
1040 IF LEN(NOS) >= MC THEN RETURN
1050 NOS = NOS + TMS
1060 PRINT TMS;
1070 GOTO 1010
9999 REM PRESS SPACE BAR TO CONTINUE
SUBROUTINE
9000 PRINT@ L(16),"PRESS THE SPACE BAR TO
CONTINUE";
9010 AS = INKEY$:IF AS <> CHR$(32) THEN 9010
9020 PRINT@ L(16),STRING$(31,32);
9030 RETURN
```

The central section of this code (lines 999-1070) tests the keyboard and will only display the key pressed if it is a digit (0-9, Ascii codes 48-64). The routine returns with *No\$* containing the characters entered. Line 1020 tests for a press of the Enter key to allow single digit entries. Notice how the prompt line, the error message and the "Press space to continue" line are erased once used.

Here is the same routine, modified to accept a string up to five characters long:

```
500 CLS
510 PRINT@ L(5),"ENTER A STRING UP TO 5
CHARACTERS LONG";
520 MC=5
530 GOSUB 1000
570 ... REST OF PROGRAM ...
1000 WDS="" :ALS=""
1010 ALS=INKEY$:IF ALS="" THEN 1010
1020 TM=ASC(ALS):IF TM=13 THEN RETURN
1030 IF TM<65 OR TM > 91 THEN 1010
1040 IF LEN(WDS) >= MC THEN RETURN
1050 WDS = WDS + ALS
1060 PRINT ALS;
```

In line 570, you might call the Accept/Reject routine to allow the user to check *Input*.

This routine is useful in that it will limit the length of an input and so can be used either to protect screen display or to force a limit on the user, but its response to the keyboard is rather slow and there is no facility to use the backspace key which can prove rather frustrating!

This program was written for the Dragon 32, but it is designed to be easy to convert for all micros.

The highest priority

Ian Logan looks at the different priorities involved in expression evaluation

One of the more important parts of the operating system of a microcomputer is its expression evaluator. In the Spectrum, there is a sophisticated subroutine that handles both numeric and string expressions. There is also provision for the handling of user-defined functions.

As with all other systems, the expression evaluator of the Spectrum considers that different operations performed within an expression have different priorities, hence avoiding any ambiguity between expressions. The priorities of the Spectrum are:

highest

Any parenthesised expression
All functions (unless excepted below)
Raising to a power
Unary minus
Multiply and divide
Plus and minus
Comparisons
NOT
AND
OR

lowest

If there should be any conflict within an expression because of identical priorities, ie, with '2*8/4', then it is resolved by taking the first operation before the second one — as might be expected.

In the Spectrum, the result of the evaluation of an expression is stored on the calculator stack. If numeric, this 'last value'

is a five byte floating-point number, but, if string, then the actual string is described with two bytes holding its length and two bytes addressing its start. The fifth byte is unused in such cases. Note also that the same subroutine is used in both syntax and run time, but in syntax checking an expression there is no 'last value', only a flag to show if it would be numeric or string.

The system variable *Ch add* is used to pick up the characters of the expression one-by-one as they are needed. The end of an expression will be marked by *Ch add* fetching a 'Carriage Return', a ':', a ';', a ',' or a 'THEN'.

The expression evaluator in the Spectrum starts at address 9467 (24FBh) and has been given the label *Scanning* by myself and *Exprn* by Sinclair. When evaluating a new expression, the first task is to place a priority marker of 'O' on the machine stack. This 'O' will be used later to show that there are no 'stored' priorities left on the machine stack.

Next, a series of functions are considered. These functions all return a 'result' that will go on to the calculator stack. The functions are listed in table one.

With all the functions detailed in the table, the 'result' goes on the calculator stack and bit 6 of the system variable *Flags* is given the appropriate value — set

for a numeric result and reset for a string result. If a 'result' is formed in this way, then a jump forward is taken to determine if the expression continues with a binary operator or simply ends.

Unary functions are considered next. In these cases, the appropriate priority and operation code are found for the function, eg:

the function NOT has the priority '4' and the operation code '240'.
the function CODE has the priority '16' and the operation code '220'.

The priority codes and the operations codes are stored on the machine stack and a jump is taken back to consider the next 'result' from the expression.

Binary operators and the end of the expression are considered together. A binary operator requires that a 'next' result is to be found, but it is possible that the 'last' operation should now be performed. All binary operators give priority codes and operation codes; eg '+' gives a priority code of '6' and an operation code of '207'. 'End of expression' gives both codes the value zero.

Once a binary operator or the end of statement has been found, the 'present' priority is less than the 'present' priority, taken from the machine stack. If the 'last' priority is greater or equal to the 'present' priority, then the 'last' operation is performed and the test repeated. If the 'last' priority is less than the 'present' priority, then the priority and operation codes are stored on the machine stack and a jump taken back to fetch the next 'result' and operator. If both the 'present' priority code

' ' ' -	a string is read directly.
' (' -	a parenthesised expression will lead to SCANNING being called recursively.
a number -	The floating-point form following the number forms the 'result'.
' + ' -	a leading 'plus' is stepped over.
' FN' -	the 'result' of the appropriate DEF FN statement is found - using SCANNING recursively.
' RND' -	The system variable SEED is updated and the 'result' obtained by taking SEED/65536.
' PI' -	The 'result' is read from the 'Table of Constants'.
' INKEY\$' -	The 'result' is a single character string in the work space.
' BIN' -	The 'result' is the floating-point number obtained by reading the operand of the BIN function.
' \$GREEN\$' -	The 'result' is a single character string in the work space.
' ATTR' -	The value of the required attribute byte forms the 'result'.
' POINT' -	The 'result' on the calculator stack will be zero or one.
a variable -	The variables area is searched for the required 'result'.

and the 'last' priority code are zero, then the expression has been fully evaluated and the single 'result' on the calculator stack is the required answer.

Consider the following example:
the expression NOT RND+2*PI

The quantities *Rnd*, 2 and *PI* form 'results', *Not* is a unary function and '+' and '*' are binary operators.

- Initially, in the evaluation, the priority '0' goes on the machine stack.
- NOT is considered next. The priority '4' goes on the machine stack, together with the appropriate operation code '220'. A jump is taken to look for another 'result'.
- The 'result' for RND goes on to the calculator stack and a jump is taken to look for a binary operator or end of expression.
- The binary operator '+' is found. So the priority code '6' and the operation code '207' are formed. Then, as the 'present' priority — the '6' — is greater than the 'last' priority — the '0' — the codes are stored and the next 'result' sought.
- The 'result' for '2' goes on the calculator stack.
- The binary operator '*' is found. Its priority is '8' and its operation code is '196'. These codes are again stored, as the '8' is greater than the '6'.
- The 'result' for *PI* is formed and stored on the calculator stack. The end of the expression has now been reached and that makes the present priority zero.
- The 'present' priority is less than the 'last' priority, so the 'last' operation is performed — '*PI*' and '2' are replaced by 2**PI*.
- Again the 'present' priority is less than the 'last' priority — '0' is less than '6' — so the 'last' operation is performed — 2**PI* is replaced by the result of RND+2**PI*.
- Again, the 'present' priority is less than the 'last' priority — '0' is less than '4' — so that the 'last'

operation is performed — RND+2**PI* is replaced by the result of NOT RND+2**PI*.

- Only now are the 'present' priority and the 'last' priority both zero. So, the exit is taken and the 'last value' on the calculator stack is the required value.

Note that the expression is numeric and bit 6 of the system variable *Flags* will be set. Also see that the three operation codes are all greater than '192'; ie, bits 6 and 7 both set. These bits are used to check the syntax of the expression, as in a numeric expression bit 6 must be found to be set on every occasion.

The actual operations are performed by calling the *Calculator* — at address 13147 (335Bh), with the operation code in the *B* register.

The expression evaluator is able to call upon user-defined functions and the implementation of these is worth considering in more detail. In the Spectrum, the user defines a function by using a *Def Fn* statement; eg:

DEF FN b(x,y)=a*x*y

and causes the evaluation of this by using the *Fn* function in an expression, eg:

LET c=FN b(1,2)

So, just what are the steps involved in evaluating *Fn b(1,2)*? The first step is to perform a program, area search for the appropriate *Def Fn b* statement (so it is best placed near the start of a program). Next the supplied values are copied from the invisible locations in the parentheses

of the *Fn b(1,2)* to the invisible locations that exist in the *Def Fn b(x,y)* statement (after the *x* and after the *y*).

The expression in the *Def Fn* statement is now evaluated by calling *Scanning* recursively, but a special point to note is that a *Flag* is set to indicate that the current *Def Fn* statement's parameters should be searched before the variables area, when the expression evaluator is finding the value for a variable.

In this way a result is obtained. It goes on the calculator stack and forms the result of the *Fn* function.

Can you evaluate these Spectrum Basic expressions correctly?
Tied up in *Nots*?

- a) *PI*
- b) NOT *PI*
- c) NOT NOT *PI*

Green on black...

Brian Cadge explains how to invert the screen display and change the text colour

The Dragon's text screen display is not renowned for being the best of all computers. Its lack of lower case letters and its small display area are often criticised. There are ways of overcoming these problems, but only by using the hi-resolution screen, which in turn uses up 6K of memory, plus another 1-2K for character sets and software.

In addition, the standard display of black letters on a glaring green square can often cause eye strain. Unlike many other computers, the Dragon does not give the user any control over the text colour.

To change the Dragon's text display to green on black (the more usual arrangement being easier on the eyes) either involves a small soldering job inside the computer (I don't recommend this!) or a short piece of software, as in the accompanying program. Luckily, every time a character is printed, a call is made to location 359. Normally, this has no effect, but we can use this to divert the computer to our own print routine.

Allowances must also be made for *Cls*

(*Cls* 1 is not the same as *Cls* — *Cls* 1 fills the screen with code 143, *Cls* fills it with 96) and the *Clear* key.

If you have an assembler package, you can enter the program directly, otherwise use the Basic loader program. This will check for errors in the *Data* statements and will not run if any are found.

The first section of the program is an initialisation routine which redirects Basic to the new routines. When a *Cls* command is encountered, a call is made to location 416 and, when a key is pressed, to location 362.

The main program is a rewrite of the screen print routine. Location 111 must be checked first — this is the channel number (0, -1 or -2). If it is non zero, the Basic is not interrupted as output is going to the printer or cassette.

When @*Cls* is executed, it checks that there is no following number (therefore you can still clear to a green screen by *Cls* 1) and then clears the screen to black. Every time a key is pressed, the program checks for code 12 (the *Clear* key) and, if

found, executes the @*Cls* routine.

As presented, the program will give orange text on a black background which is best for a monochrome television. For a colour tv, green on black is easier to read — type *Poke* 32644,5 to change to green and *Poke* 32644,13 to change to orange. All other print commands are unaffected, only the text is inverted. Lower case will now appear as black on green.

Another useful routine which can be achieved by changing location 359 is a printer echo — type *Poke* 360, 189: *Poke* 361, 26: *Poke* 359, 126 to turn on the echo and *Poke* 259, 57 to turn it off. Of course, if you are using a printer which has a buffer (as most modern ones do), printing will only take place at the end of a line.

While on the subject of printers, some difficulty has been experienced by users whose printers do not auto linefeed at the end of a line. The Dragon can send a linefeed to the printer for you if you *Poke* the following locations:

- 155 — number of columns (normally 80 or 40 or 120)
- 153 — comma field width (normally 16 — the number of spaces between items printed separated with a comma)
- 152 — PEEK(155) — PEEK(153)
- 328 — 0 equals send linefeed at end of line, 255 equals send no linefeed (assumes printer will auto linefeed)
- 330 — 1 is normal setting, 2 will give extra linefeed with every new line (ie, will leave a gap between each printed line).

Extend the sound capabilities of your Dragon

FOR DRAGON 32

**—DRAGON 32—
SOUND EXTENSION MODULE**

- Fully-cased Module plugs into cartridge port
- Provides 3 channels of sound: 3-note chords and harmonies over 5 octaves
- Uses new BASIC command. No need to 'Peek' or 'Poke'
- Many built-in sound effects (eg bomb, laser)
- Music and graphics can occur together without loss of speed
- Based on popular, well-proven sound generator
- Two Input/Output ports included
- User manual provided, with examples

**ONLY
£34.95
inclusive**

The Wizard's Warriors

THE WIZARD'S WARRIORS: A fast moving game that matches developments in your skill as a player by becoming increasingly more devious. By offering to you the full range of options you can choose how to control your warrior through the maze. A full implementation of this program enables such features as a continuous series of sound effects, arcade quality graphics, double-point scoring, and—for the very artful—bonus lives.

Spectrum £4.95

FORTH: A full implementation. Ideal for writing fast moving arcade type games. Allows the full colour and sound facilities of the Spectrum to be used. Future Microdrive enhancements will be made available.

Spectrum 14.95

ADVENTURE ONE: Features a save game routine as the game can take months to complete. 'a remarkably good version....well worth the money.' ...Sinclair User...

ZX81 £5.95

MAZEMAN: A fast action m/c game that reproduces the spirit of the original. '...is very accurate and fast.' ...Which Micro?...

**Spectrum £4.95
ZX81 £4.45**

CHESS 1.4: Ten levels of play with this m/c program. Good graphic screen display. 'In a class of it's own.' ...Your Computer...

ZX81 £5.95

INVADERS: Very fast m/c action. Includes mystery ship and increasingly difficult screens.

ZX81 £4.45

Flying the flag . . .

Michael Batty presents a program to draw the Welsh flag

There are plenty of programs around for drawing flags with regular geometric properties such as the Union Jack, but programs for irregular designs are more unusual. This program draws the Welsh flag which consists of a red dragon laid across the join of two rectangles, the top rectangle being white, the bottom green.

The program is designed for the BBC model B computer and plots a series of flags of different shapes and sizes in the

colours of the Welsh flag using *Mode 5*.

The program illustrates a number of important features of BBC Basic. There is extensive use of procedures to read in data, print text captions and plot the flag itself. The flag is constructed using the triangle fill routine *Plot 85*. The upper and lower rectangles are plotted first and then the co-ordinates of the dragon, stored by sequence in arrays, are used to construct and fill the shape of the dragon. The

program also shows how the shape and size of the basic flag can be transformed by scaling the co-ordinates and plotting the flag in different positions on the screen.

The program is structured to first read in the 225 x-y co-ordinates of points defining the dragon from data statements. Then a full screen flag is plotted with greetings captions in Welsh and English. If you look closely when the flag is plotted, you can see the triangle fill routine at work. The vertical and horizontal scales of the flag are then systematically altered and different sized flags plotted. Finally, nine small identical Welsh flags are plotted on the screen showing the limits of resolution for *Mode 5*. ■

At last! A joystick that works!

Cambridge Computing bring you the first intelligent joystick.

Works on all existing software - regardless of which keys the program
uses. No need for specially written software. Features include:

- Compatible with Spectrum, ZX81, Jupiter Ace
- 2 Independent Fire Buttons
- 8 Directional Microswitched action
- Plugs into edge connector
- Interface complete with edge connector
- Atari joystick compatible
- Joystick with Interface £29.90

« CAMBRIDGE COMPUTING

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Year Graph

on Spectrum

A program which will construct a graph from a series of figures. An option is available to superimpose one graph on another.

Program notes

5 Sets default variable 's' (used in Line 110).
10 Sets up array 'y' one for each month of the year.

20 Inputs and checks for correct length the title of the graph.
30 Prints the title and erases any previous title.
40 Draws, in chunky graphics, the base line of the graph.
50 Sets a\$ to the initial letters of the months of the year.
60 Prints the initial letters of the months of the year under the base line.
70 States the maximum input values allowed.
80 Prints an empty column for printing the input values to.
100 Starts a loop, one for each month of the year.
110 Inputs data. If no more data 's' defaults

and Goes to 170.
120 Checks size and range of input and states if out of range and Goes to 110 to re-input correct data.
130 Prints data just input on the empty column opposite the now inverted initial letter of the corresponding month.
140 If data is for the first month then plots a point on the graph corresponding to the value of that data.
150 For the subsequent months draws the appropriate line.
160 Completes the loop.
170 Asks whether a scale is wanted. If not Goes to 200.
180 Draws requested scale.
190 Asks if printer copy is required.
200 Copy's required graph.
210 Asks if another run is required.
220 Stops if no more runs are required.
230 Asks if next graph is to be superimposed on current display.
240 If superimposition is required Goes to line 10 without Clearing the Screen.
250 If no superimposition is required then Clears the Screen and Goes to line 10.

```

SPECIALLY FOR THE DRAGON USER

2 books from Sunshine

Dragon Games Master is a carefully structured book about writing games programs. All major aspects of interactive computer games are considered as you learn how to handle sound, colour, graphics, movement, mazes, detection, decisions, responses, consequences, scoring systems, status displays, economics, skill levels, title sequences and instructions. You will learn how to include these features in all your own games. The book takes you through each step line by line from writing the simplest games right through to the design and construction of first class adventure programs which rival commercial software in their complexity and presentation. (160pp) £5.95

Dragon 32 Games Master

NEW
RELEASE

The Working Dragon 32

The Working Dragon is the book for those of you who dream of putting your computer to some practical use. It is based on a collection of solid, sophisticated programs in areas such as data storage, finance, graphics, household management, education and games of skill. Some of the more advanced programs include a Text Editor, which can perform many of the functions of a word processor, and Music Editor, which will let you write long music programs without endlessly repeating similar routines. Each of the programs is explained in detail, line by line. And each of the programs is built up out of general purpose subroutines which, once understood, can form the basis of any other programs you need to write. Advanced programming skills spring out of the discussion explaining each subroutine. The collection also leaves you with a wide range of practical application programs which might otherwise only be available on cassette. (160pp) £5.95

SUNSHINE

Caves of Worrnam

on Atari

This a game for the Atari 400 with 16K and Basic cartridge. The game is called Caves of Worrnam and is a one-player game in which a joystick is needed. This should be plugged into the left-hand socket. The aim of the game is to try and cross the screen from left to right as many times as possible

following the instructions in the listing. There is full use of graphics and sound in this game.

Program notes

Lines 5-174 Initialise values and sets the shape of the starship at line 120.
180-310 Starship movement is done here using machine code for a smoother movement for the starship. Lines 230 and 240 check ship for a collision.

600-674 These lines are only used if a starship collides with an object, so that the game will be ready for restart.
800-815 Set graphics for the other shapes to be used
816-850 Draw initial set-up on screen
2000-2010 Set shape of the cave to be used throughout play
3000-3100 Landscape is caused to scroll from right to left
5000-5050 Control movement of Worrnam
9000-9110 Set up for initial instructions for playing this game

Edt

on Lynx

The Lynx editing commands allow you to edit a single line at a time. To copy a line you have to call it up using ctrl/e and the line number, delete the current line number and then type in the new one. To copy 50 lines repeat this 50 times. This is tedious, to say the least, and this article describes a machine code routine to perform multiple line copies.

It is necessary to understand how the Lynx stores a basic program. A line of a program is not stored in the same form as you type it in, but is encoded into a more efficient form before it is stored. This also means that the line must be decoded before it can be edited or listed which partly explains why the Lynx is slow in listing a program. This encoding can be illustrated by considering the one line program: 100 a = 1.

The Lynx stores information (data, programs etc.) as a series of bytes. If you use the monitor command h to look at memory you will see the contents displayed as pairs of characters. These characters, the numbers 0-9 and the letters a-f, are hexadecimal digits. Each digit represents four bits and a pair of hex digits makes up an eight bit byte. The one line program above would appear, using the monitor command h694d, as given in Figure 1.

The first line of your basic program starts at address 694d (all addresses are given in hex). Each line consists of five parts. The first five bytes are the line number, with bytes two to five holding the eight digits of the line number and byte one indicating where the decimal point should

be placed. Byte one has the form cn where n means there are n + 1 digits to the left of the decimal point. (Of course, for integer line numbers the decimal point is not printed, but on the Lynx 325.07 would be a legitimate line number. This facility will be used in the program.) The next byte gives the length of the encoded line in hex and byte seven is a code indicating the type of command used in the line. The last byte of the line is 0d (return) and the other bytes are the encoded line. The length of that section varies depending on the command.

Note that the 1 in a = 1 is encoded as c0 10 00 00 00 using the same representation as the line number. The end of the program is indicated by the byte 80 immediately after the 0d of the last line in the program.

Now that you know how a basic line is stored, how can you find it? The Lynx has a non-standard command called lctn which returns the address of byte eight of the line. For example, lctn(100) would have the value 6955 hex. Hence lctn(s) - 7 is the first byte of line s and its length is stored in lctn(s) - 2. The other commands used are peek (x) which returns the value stored in memory address x, dpoke x,y which stores the two bytes of y in addresses x (least significant byte) and x + 1 (most significant byte), and call x which calls the machine code routine starting at address x.

A listing of the basic procedure is given in Figure 2. It simply stores the relevant addresses of the lines involved in the copy and calls up the machine code routine. Remarks have been omitted from the program to reduce the length as explained later.

Program notes

Lines	
10	Skip past procedure when running program
20	The parameters are: s — line number of first line to be copied e — line number of last line to be copied d — line after which the lines are copied
30	Error testing. The last line can not be less than the first line and the lines can not be copied into the procedure itself. A 'number out of range' message will appear if these conditions are not met.
40-70	Store addresses in memory for use by the machine code routine
40	First byte of s
50	First byte of line following line e
60	First byte of line following line d
70	First byte of line d
80	Call machine code routine
110-140	Reserve memory for the machine code routine and read it from tape. These lines are then deleted

The machine code routine

The machine code routine was written in Z80 assembler and hand converted into hex bytes. The code is stored in the upper part of memory reserved by the basic in line 110. The program starts at address &9f10 and the data is stored from &9f00. I used this method rather than the code command in basic for several reasons. First, I know where the data is and can load it directly; secondly, there is no limit to the number of bytes in a program as this is in a code line and also the code will remain after a new command.

Figure 3 gives a listing of the routine as it would appear using the monitor command h9f10. The first four digits in each line are the address of the first byte of that line. To enter the routine first type Reserve &9f00. Then enter the monitor and type m 9f10 and enter the bytes as given. Briefly, the routine performs the following:

FIGURE 1 ONE LINE PROGRAM.

```
694D C2 10 00 00 00 12 00 41 B.....A
6956 3D 7D 7E C0 10 00 00 00 = @....
695D 7F 0D 80 ..
```

FIGURE 2 BASIC PROCEDURE

```
10 GO TO 100
20 DEFPROC C(s,e,d)
30 IF e<s OR d<100 OR e<=100 THEN ERROR 13
40 DPOKE &9F00,LCTN(s)-7
50 DPOKE &9F02,LCTN(e)-7+PEEK(LCTN(e)-2)
60 DPOKE &9F04,LCTN(d)-7+PEEK(LCTN(d)-2)
70 DPOKE &9F06,LCTN(d)-7
80 CALL &9F10
90 ENDPROC
100 REM : PROGRAM STARTS HERE
110 IF HIMEM>&9F00 THEN RESERVE &9F00
120 MLOAD "IT"
130 DEL 110,140
140 END
```

1. It determines the total number of bytes in the lines to be copied.
2. It moves the lines which follow line d higher in memory by that number of bytes.
3. It copies the lines into the space created in 2.
4. It updates the pointers to the last byte and the last byte + 1 (the byte containing 80).
5. It rennumbers the copied lines. The new line numbers are formed as follows. The first three bytes are the same as the first three bytes of the line after which the copied lines appear. The last two bytes are bytes two and three of the original line. If you were to copy line 120 as part of a block of lines copied after line 250, it would be rennumbered to 250.012, since the trailing zeros are not printed.

After entering both the basic and machine code routines save them to tape using the following three commands:

Save "ed", 110
Mon

d 9f00 9fff 0 "it"

A fraction of a second of blank tape should be left between the save and the d commands. Now the two routines are automatically loaded by the single command, load "ed". Once "ed" is loaded it starts executing at line 110, and reserves memory, loads the machine code routine "it" and deletes the lines from the basic program.

To start a new program simply type auto. This will overwrite the remark in line 100. If you wish to edit an old program, assuming it starts with line 100, delete line 100 and then append "program name". This is why the procedure was kept to nine lines at the expense of remarks. Finally, if

you wish to renumber your program use renum 10 to keep the first line of your program at line 100.

Using the routine

The routine is used directly from the keyboard rather than as part of a program. Taking advantage of the Lynx's ability to recognise p. as proc, to copy, for example, lines 200 to 250 after line 500 type p.c(200,250,500).

The prompt reappears almost immediately. Now lines 200 to 250 will appear as lines 500.02, 500.021 500.025. The original lines are still there, but by deleting those you have a multiple line move as well.

Bouncing Ball

on ZX81

Here is a program to show what can be done with the 1K of ZX81 memory, in Basic.

It displays the path of a bouncing ball moving from left to right, across the screen. By adding *Unplot* statements to

lines 115 and 225 the ball, by itself, bounces along in real time.

By adding the following line:

145 IF D = Val "64" THEN run

the ball restarts after reaching the right-hand side.

All three lines will fit into memory, but the ball may 'miss' or might not appear at the place you expected.

Variables

H — Height of ball
G — Gravity (acceleration of 1kg per second)
D — Distance travelled (horizontally)
A — Speed of ball

Program notes

Lines
110-160 Routine for ball going down
220-270 Routine for ball going up
100 Balances line 210
210 Increases G so ball slows up quicker (to simulate the energy lost through sound and heat)

```

5 CLS
10 LET H=CODE "E"
20 LET G=VAL ".9"
30 LET D=CODE " "
40 LET A=CODE " "
50 LET G=G/VAL "1.1"
110 PLOT D,H
120 LET A=A+G
130 LET H=H-A
140 LET D=D+CODE " "
150 IF H<CODE " " THEN GOTO COD
160 GOTO 110
200 LET H=-H
210 LET G=G+VAL "1.1"
220 PLOT D,H
230 LET A=A-G
240 LET H=H+A
250 LET D=D+CODE " "
260 IF INT A=CODE " " THEN GOTO
VAL "300"
270 GOTO 220
300 LET H=-CODE " "
310 GOTO VAL "100"

```

Bouncing Ball
by Mark Colson

DRAGON 32 ACE HIGH

Summer 1940. You are at the controls of a lone Spitfire unleashing its eight machine-guns on a squadron of Heinkel bombers. Dodge the Heinkels' guns. Look out behind for Messerschmitt fighters (rear mirror feature). Eyes peeled for sweeping frontal attacks — and shoot down that brave German who tries to take you head-on!

Features:
High resolution graphics, 3-dimensional action, cockpit view, realistic sounds, reward system, detailed scorecard.

The keys allow choice of colour or B and W, also joysticks or cursors. This game exploits the Dragon's facilities to the full, using all 32K. Not available in or to libraries or club system. £7.95 includes P&P.

M & J SOFTWARE

fig-FORTH FOR THE DRAGON £10
This cassette-based package represents fantastic value for money. It consists of the FORTH language, the standard editor and our 6809 macro assembler. Documentation consists of the fig-FORTH installation manual plus lots of example programs, memory map, etc.

DRAGON COMPANION BOOK £4.95
The DRAGON COMPANION has been well received by thousands of DRAGON users throughout Europe. It was written by M. Jarvis who has an honours degree in computer science from Keele University. Packed full of useful information — including a listing of a full 6809 disassembler.

ASSEMBLY SOURCE LISTINGS OF fig-FORTH £7 each
These standard fig-FORTH assembly listings are available for the following processors: 6502, Z80, 6809, 8080, 1802, 9900, 6800, 8086, 8088 and POP-11.

fig-FORTH INSTALLATION MANUAL £5
This is a complete guide to implementing FORTH from the above listings.

6809 and 6502 MACRO ASSEMBLERS £5 each
These programs are structured one-pass assemblers which will work on any fig-FORTH implementation with the minimum of alteration. They are provided in listing form together with instructions on use and an example program. Cassette recordings can be provided for DRAGON or MICROTRAN users at £1 extra.

ALL ABOUT FORTH BY HAYDON £7.95
An annotated glossary of FORTH with cross references to fig-FORTH, Starting FORTH and the FORTH-79 Standard. Invaluable as a work of reference.

Cheques and POs to: M & J SOFTWARE, 34 GRAY'S CLOSE, SCHOLAR GREEN, STOKE-ON-TRENT ST17 3LU. Tel: (0782) 517876.

Self Adhesive Cassette Labels

★ **CASSETTE LABELS ON ROLLS** — Complete with tractor feed perforations to allow them to be printed in most modern computer printers. Now you can have "instant" labels, exactly when you need them! Minimum order 500 labels. £11
Cassette labels on sheets — 15 labels per sheet. These labels are suitable for rapid application by hand to cassettes and can easily be printed by any local instant print shop. They are also ideal for use in typewriters or word processors. Minimum order 100 labels. £3.50

★ **SMALL COMPUTER LABELS** — Many micro computer users are finding that they are able to provide a unique and profitable service to businesses in their locality. We manufacture a wide range of small computer labels at very attractive prices. They are used for so many purposes that it is difficult to list them, but price changing, tagging, coding and marking are some examples.

NEW — Sampler pack of all of our different types of label — £2.00.

All the above prices include VAT & carriage. Excellent quantity discounts. PLEASE SEND 16p STAMP FOR PRICE LISTS AND SAMPLE LABELS.

THE VERY NEWEST VIC20 GAME NEUTRON ZAPPER

You are the pilot of the fastest starship in the galaxy FREEDOM FIGHTER. It has dual anti-gravity thrusters and a laser cannon that will ZAP any of the enemy craft this side of BETELGEUSE. You have been chosen to fight for the rebel forces against the enemy. Your life expectancy is only a few minutes — first you have to manoeuvre through a radio-active asteroid belt avoiding the exploding fragments. Because of the high radio-activity in this area your forward thrusters have run out of control and so the ship is constantly accelerating until you finish the phase. Once you are near the enemy's base planet you have to ZAP the Imperial Star Destroyers. If you can survive them, then you are confronted with the most terrifying of all, the menacing Maniac Mutants from the high gravity planet of DARG II. They swarm around like slugs but zillions of times faster.

The game includes:

- ★ 100% Machine code for incredibly fast arcade action
- ★ High Resolution multi-colour graphics — realistic movement!
- ★ On-screen score and high score
- ★ Ultra Froody sound will blow your mind
- ★ Hypnotically moving aliens threaten your deteriorating sanity
- ★ Increasing difficulty for continuous challenge
- ★ Unexpanded VIC20, Keyboard or Joystick Control
- ★ Colours that range from infra dead to ultra violent

If you, a mere mortal, can take on the challenge of NEUTRON ZAPPER then you know the terms . . .

The best game ever developed for the VIC20 including full money-back guarantee, mind eroding fun and super-fast delivery:

Tony Bridge's Adventure Corner

Energy barrier

Have you ever noticed the many different ways that people stub out their cigarettes? Some crush them with great force, and then blow the ash dismissively from their fingertips (the grosser smokers actually lick their fingers clean! Yuk!), whilst others meekly hold the cigarette at arm's length and gently fold it against the edge of the ashtray, as if afraid to wake it up!

Yet others grind the end round and round until the poor thing finally succumbs. You can tell these easily — they are usually jumping up and down, blowing on their fingers!

There are those smokers who allow the surrounding company to participate in their activities — that is, everyone rushes to stem the acrid cloud of smoke as the butt burns merrily away in a heap of ash and filters. Sounds disgusting, doesn't it? And what on earth, you may ask, has this to do with adventure games?

Well, it occurs to me that people play adventure in the same way that they might put out a cigarette. Some approach the game cautiously, whilst others charge in recklessly, throwing all aside in their impatience. A number of people believe in the committees and rope in friends, neighbours and the cat to help them in their quest!

There's probably a middle way that is the best — all will achieve their purpose in the end, but caution spiced with a bit of daring and leavened with an ability to accept advice and help will result in a better game.

All you'll need to play Crystal Computing's latest adventure, *Halls of the Things*, is an itchy trigger finger! One of the best arcade games I've yet seen for the 48K Spectrum, *HOTT* has a decided bias to the Dungeons and Dragons sort of scenario.

A huge tower, surrounded by an acid-filled moat, boasts a stairway which links its eight storeys. At each level is an energy barrier and behind each one you catch glimpses of *The Things*, terrifying humanoid incarnations trained many T-states ago by the three Evil Lords of the Halls and imprisoned for all eternity. I don't know what it all means either, but it makes for a sensational game!

Your mission is to brave these awful

Things and collect the seven spectral rings. Only when in possession of these can you then find the key in the lowest level and escape. Of course, these *Things* aren't going to let you get away with it easily — they are out to get you.

The mechanics of the game are superb, finely-balanced between simplicity and addictiveness. The game is quick to play, or at least quick to lose ... if you're winning, the game will last a long time.

There are, as we've seen, eight levels. The bottom one is impenetrable until you have all seven rings, but the others may be entered or left at will. They do, however, get harder as you progress towards the bottom of the tower. Each level consists of a maze, either more or less complicated, which is guarded by *Things*. These *Things* come in several shapes, and these each have their own characteristics. They're all completely deadly!

To combat them, you have a certain amount of magic, which you can use to loose off highly accurate fireballs, or lay down blanket fire with lightning bolts. You also have a large amount of unmagical, but no less effective, arrows. These are useful when your magic runs low. Bottles of elixir are scattered throughout the halls which replenish your magic, along with little piles of treasure. Take care, though, these little goodies may be *Things* in disguise which, as soon as you round the corner, will come after you.

Moving around is very easy and the graphics and colour are superb. If you are using a monochrome set, you may adjust the contrast from within the program. A nice touch.

A high score is included, by one Kickaha (all Philip Jose Farmer fans will understand this reference), of 100 points and, for all I know, a blaze of trumpets and singing angels if you beat this! I've only scored 35 so far, though in my defence I've only had the game for a couple of weeks (and I haven't found a ring yet, but I will, I will!).

It's not often that you see the authors of a game glued to it, as I saw happen at the Earl's Court Fair recently. And even they have only completed the game once!

If you enjoy sitting up until 4 am having "just one more go to beat this thing", you'll love this game — I can't recommend it highly enough. ■

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Are you stuck in an adventure? Are you faced by a problem that seems insurmountable? Adventure Helpline may be the answer.

Adventure Helpline is, quite simply, designed to put adventurers in touch with one another. Where you may be stumped by a baffling puzzle, a fellow adventurer may be able to help. By the same token, you may be able to help other people with their problems.

If you are having difficulties with an adventure, fill in the accompanying coupon and send it to:

Adventure Helpline
Popular Computing Weekly

DEPT (PCWK)

A GOOD BUY?

Andrew Raksey of Lawson Crescent, Banchory, Scotland, writes:

Q I am a Dragon owner, and I am looking for a reasonably priced printer. I have considered CGP 115, but it is too expensive. I am now looking at a ZX printer as it is cheap and can produce graphics. Do you know if it is compatible with the Dragon, and would it be a good buy?

A Given that the CGP is four colour, I do not feel that it is fair to call it over-priced. Printers are one area where generally the more you pay, the better quality and performance you will get. The ZX printer could be made compatible, but it would take some re-coding, and a specially-built interface. Microtanic used to do a series of interfaces for 6502-based computer, so they could be used with the ZX printer, and, of course, the 6502 is a relation to the Dragons 6809. But at around £30 a time it in effect put the price of the printer up to the £80 bracket. It would be possible to build your own, but I do not have sufficient knowledge to tell you how difficult it is.

The only thing I can suggest is that you take a look at the Amber, which should work out at a little under £90 inclusive. This is a dot matrix printer, but it is small and cheap. However the paper is ordinary till roll paper and only two and a-half inches wide. It does provide a clear hard copy, and has the options for graphics and double-size characters, but with only 24 characters per line. If you want cheap, clear printouts of programs, then this is probably the best bet, as long as you accept its limitations. A modified form

of Centronics interface will be needed, but full and further details can be obtained from Lethaby Numbering Systems Ltd, Central Way, Walworth Industrial Estate, Andover, Hampshire SP10 5AL.

FLASHING COLOURS

Robert Stacey of Ranleigh Drive, Edgware, Middlesex, writes:

Q When using my Spectrum, I always make the keyboard beep by typing *Poke* 23609,50. However, by accident, I typed *Poke* 22609,50. This produced a pale coloured square in the top left-hand corner of the television screen. By *Poke*ing in different numbers I got light and dark colours (I use a black and white television). For example, if you *Poke* in 255 you get a bright square and 230 will give a colour flashing on a bright surface. I would be grateful if you could tell me what is happening, as I would like to experiment.

A What you are doing is *Poke*ing into the attributes file, which extends from 22528 to 23295. Each address stores the detail of one 8 x 8 square, starting in the top left-hand corner, and working along the first line, then returning to the start of the second line working along that line and so on. The number held in the address is converted into binary which in turn controls the attribute. Bit 7 controls *Flash*, (1 = *Flash*, 0 = *Steady*), bit 6 controls *Bright*, (1 = *Bright*). *Paper* is controlled by bits 5,4,3, and *Ink* by the remaining three bits. A table which shows in more detail how the *Paper* and *Ink* attributes are made up is given in *The Sinclair Spectrum In Focus* by Mark Harrison, and published by Sigma. In the meantime to give yourself some idea of how this works, try this:

```
10 LET a = 22528
20 LET b = 0
30 POKE a,b
40 LET a=a+2
50 LET b=b+1
60 IF b> 255 THEN STOP
70 GO TO 30
```

This will run through all the 256 possibilities that can be *Poked* into the attributes. The only reason that I have incremented the addresses by

plus two, is to provide a bit of visual clarity.

In point of fact you are unlikely to need to attribute file a lot because you have the *Attr* command, which in effect *Peeks* the attribute file, and returns the values stored at a specific address.

ON/OFF SWITCH

D. L. George of Victoria Road, Shoreham-by-Sea, West Sussex, writes:

Q One of the most frustrating aspects of working with a home micro must be the pushing/pulling of jack plugs, and fiddling with the volume controls. I've noticed some leads offered complete with selector switch and on/off switch.

Would it be worth taking this to its logical conclusions and soldering the computer leads direct to the cassette players' circuit board? How about dedicating the cassette play completely and removing all the unnecessary bits.

My micro is a Dragon 32, and the player I have in mind for surgery is an Hitachi TRQ 289. The circuitry seems straight forward, and I think my soldering skills are adequate. Do you think this would be a wise course of action?

A Not really, unless you think it will genuinely improve the performance of your tape player when it comes to *Loading* and *Save*ing. I do not know the model you mention, but if it doesn't have a tone control then a project for wiring in such a control might be useful. Tone control is one of the important aspects of the whole gamut of *Load/Save* problems.

If you have confidence in your ability you might well find it easier to alter the azimuth of the tape head to the tape. This can be an important influence on your cassette's performance and would probably be easier to do, than the hard wiring you suggest.

The other side of this question is one of convenience, and assuming you wired in an on/off switch, and the whole system worked well, it would stop leads pulling out when you get carried away playing *Space Invaders*. It would also offer you the option on keeping your computer on a piece of board that would be easier to store. If you do go ahead and modify, then you could wire the volume and tone controls to a special panel, which would make it easier to get to.

WHICH ISSUE?

Michael Lee of Hill Road, Barnsley, writes:

Q Even though it will cause me problems with the guarantee, I am going to purchase a Spectrum upgrade, to make my machine 48K. How do I find out though if my Spectrum is issue one or issue two?

I would also like to add that I think it is bad of Sinclair not to bring out their own up-grade as promised.

A There are two ways of telling the two issues apart, on 16K Spectrums. On the underside, a little off-centre, you will see a recessed hole, at the bottom of which is a very small brass screw. This is, in fact, a variable capacitor, and enables the user to tune the Spectrum in a little more easily. This only appears on the issue one Spectrums. Also, if you look at the port at the back the width of the contact fingers are more or less the same as the gap between them. On issue two Spectrums, these contact fingers are very much wider, and the gap between them correspondingly smaller.

As for Sinclair failing to bring out their own memory extension, I feel it is another case of a British manufacturer failing to get his marketing together — by now it would not be worth them bringing their own expansion out.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

VIC20 C2N cassette deck, 16K, hi-res + 3K, joystick, 6 months old, nearly 100 games, offers accepted. Tel: 01-948 0507.

Acorns for sale

ACORN ATOM, 12K, floating point Rom, power supply unit, books + programs, excellent condition, £125. Tel: Billericay 51428.

BBC MODEL B, 1.2 operating system with tons of software including Wordwise, £495. Tel: 0482 849517.

BBC MODEL A, 32K plus VIA, much software including Acornsoft, cassette, leads, manuals, original packing, very good condition, £285 ono. Tel: Billericay 51428.

BBC MODEL B, 1.2 operating system, paddles, lots of software, in mint condition, cassette and leads, £350. Tel: Maidstone 861800.

For sale

DRAGON GAMES for sale or swap. Microdeal. Sale £6 each. Tel: 051-263 8351, Paul after 5.30 pm.

GOLFBALL PRINTER/TYPewriter, with serial interface (135 bode, 15 characters per second), 12-pitch correspondence quality, £190 ono. Z80 software supplied (bode rate generator for Nascom available). Tel: Mike 01-874 6244.

MY ENTIRE SPECTRUM software collection, well over 50 tapes including Hobbit, Frenzy, Horace and Spiders, Galaxians and many, many more. Sale price £75 the lot. Tel: Harpenden 69152.

SHARP MZ80A, Basic and Pascal unit, £400. Tel: Orton 283.

VIC CARTRIDGES amplifier, £15, Cloud Burst £12, 8K Ram £25. Tel: Johnstone 21027.

FOUR ACORNsoft, £6 each or the lot for £20. Arcadians, Planetoid, Rock-raid and Snapper. Tel: Saddleworth 2518.

SHARP MZ 80K — 48K MANUAL, Basic tape and various games, £230. Tel: Burn 210 after 5 pm.

VIC20 16K Ram + software, £50+. Tel: 01-574 4122.

PCS DIGITAL SYSTEM for BBC, including software, hardly used, £95 ono. Tel: 01-203 5355.

DATA DYNAMICS Teletype 33 RS232 interface, good working order, £40. Tel: 445 0921 (after 6.30 pm).

ASTRONOMICAL/TERRESTRIAL telescope, full size, wooden field tripod, accessories, including 3 eye pieces, 6mm, 15mm, 25mm, accessory tray, a correcting prism, extension tube, 5x25 finders scope, 710 focal lens, 16mm object lens, swap for ZX Spectrum. Tel: Sheffield 322496.

INTELLIVISION + nine cartridges, boxed, guaranteed, £135. Tel: 01-310 8109, after 5 pm.

SPEECH SYNTHESISER for Vic20, £45 ono. Tel: 05432 53344.

TRS 80, Model 1, level 2, 48K, internal mod, lower case mod, parallel printer interface, including much software, £450. Tel: 0795 534170.

DRAGON DATA JOYSTICKS, £15, or swap for chess cartridge; also Dragon cassettes for sale. Tel: Darlington (0325) 283898.

SWAP GRANDSTAND ASTROWARS for ZX81. Tel: (Ivan) Wigan 58719.

NORTH STAR HORIZON, 10 megabyte Winchester disc, Epson printer with 2K buffer, £3,000 ono. Tel: 435 5466, Bergin.

TRANSTEC BC5 word processing system, Wordstar based, £1,000. Tel: 051-644 7989.

FIVE ROLLS OF ZX PRINTER PAPER, £7. Tel: Basildon 553963.

VIC20 Arlon expansion unit, 7 cartridge slots, complete with lid and cables, excellent condition, £59. Tel: Dudley 57360.

MATEL INTELLIVISION + 13 cartridges and voice synthesiser + 3 voice cartridges, £140 ono. Tel: Derby 764595.

TANGENIC MICROTRAN, 65 full keyboard, 10K Basic toolkit, 5K Ram, can be expanded, complete documentation, £150. Tel: 0480 66086.

APPLE 3 SYSTEM + profile storage, 5 megabyte Winchester, protected backup facility, Pascal and Visicalc, 128K memory board, 2 years old, reason for sale moving on to larger system, Orbit system for software, £3,600. Tel: 242 0431 (Manhattan Fanning Collyer).

BBC JOYSTICK INTERFACE, compatible with Atari and Vic joysticks, £10 for 2 sockets. Tel: 01-571 2870.

FULL SET OF Popular Computing Weekly, £12. 01-947 6953, evenings.

NASCOM 1, 48K Ram, Super Mum with PSU, Rom Basic, 5000 Baud cassette system. Emigrating, must sell by July 18. Bargain at £200. Tel: Stevenage 66355.

APPLE DISC DRIVE + disc controller + DOS, £140 ono. Tel: 0204 41459 (Bolton).

SHARP MZ 80K, 48K memory Basic + Basic + Pascal, Forth and machine code, Apollo word processor, 100 program library, £350. Tel: Tewkesbury 297579.

VIDEO GENIE 3003, damaged but working, £60 ono. Tel: 021-550 4609.

ONE 48K for sale, still in box, £120. Tel: Rotherham 0709 530336.

MATEL INTELLIVISION, excellent condition, six months old, 10 cartridges, £190 ono. Stevenage 0438 55583 (anytime).

PHILIPS G7000 + five cartridges, five months guarantee, £85 ono. Tel: Crayford 526502, after 6 pm.

C2N CASSETTE DECK for Vic20, £35 ono. Tel: New Mills 42496, evenings.

MATEL INTELLIVISION + voice synthesiser, 21 cartridges, including two voice ones, £220 ono. Tel: Southampton (0703) 464186, after 6.30 pm.

SHARP COMPUTER with own TV monitor, 1200 bit/sec cassette recorder and full 48K Ram, good graphics + software and manuals, £270. Tel: 03564 7220.

CENTRONICS 306 PRINTER, 80 column, upper case only, complete with manual, can be seen working, £65. Tel: 090-66 5483 (Sussex).

LYNX 48K, boxed, five months old, excellent condition, reason for sale: upgrading to Apple, accept £150 for quick sale, no offers. Tel: 0224 820940 (Neil).

JUPITER ACE, full leads, manual and five programs, still boxed and in mint

condition for only £65. Tel: Conway 2345.

INTELLIVISION + three cartridges, £75. Tel: Nottingham 292205 (Paul).

SHARP MZ 80A, 48K Ram, excellent condition, with £75 software, manuals, dust cover, built-in monitor and cassette deck, still under guarantee, £530. Tel: Maidstone (0622) 65589.

MATEL INTELLIVISION with 17 cartridges including D&D, Pit Fall and Night Stalker, £230. Tel: 0726 63501, evenings.

48K LYNX, excellent condition with tapes, £200 ono. Tel: Swansea 0792 891578, after 6 pm.

LYNX 48K, £185 for quick sale. Boxed as new, also books, manuals + software, etc. Tel: 01-399 4321.

JUPITER ACE + power supply + all leads, £70. Tel: Leigh 0942 674698.

SHARP MZ80, 48K computer, immaculate condition, dust cover, manuals, magazines, etc, over £120 programs, guaranteed September, accept £295 the lot. Tel: Chester 675717.

INTELLIVISION + nine cartridges, boxed + guaranteed, £135. Tel: 01-310 8109, after 5 pm.

Wanted

BBC MODEL A OR B wanted. Tel: 01-897 6274.

WANTED: BBC MODEL B. Tel: Rotherham 525913.

WANTED: DRAGON 32 — will swap for 48K Spectrum + all leads + software. Tel: Mountain Ash (Mid-Glamorgan) 475921, evenings.

WANTED: ANY COMPUTER but ZX81 in exchange for trumpet + case + mute, worth £90 ono. R. Ackbrough, 13 Sunny Hill, Sea Mills, Bristol BS9 2NG.

SWAP A RADIO CONTROLLED 1/16th scale model car + all accessories, worth £450 for a BBC Model B. Cash adjustment in buyer's favour. Tel: 01-600 0818, ext. 268, Mr. Young (10 am—5 pm only).

WANTED: VIC20 INTRODUCTION TO BASIC, Part 1 or 2. Tel: 01-574 4122 (anytime).

WANTED: VIC PROGRAMMERS REF GUIDE, £7. Tel: 0902 893084.

WANTED: COMPUTER PEN PAL owning a 48K ZX Spectrum to exchange programs and swap tips, 10 to 14 age group preferred. Write to Paul Phillips, 13 Mountain Road, Conway, Gwynedd, North Wales (enclosing age and address).

WANTED: 16K SPECTRUM and cassette recorder. Cosham 387158 (Chris).

WANTED: 16K RAM PACK for Vic20. Tel: 04862 70318.

TANDY COLOUR + Dragon users wanted to swap ideas and information. Tel: Mark Davies (0922) 691618.

SPECTRUM 48K WANTED. Call 01-529 4718 in the evenings.

WANTED KARGA 12-inch monochrome monitor for BBC micro, exchange for Wordwise chip and software. Tel: Hull 849517.

COMMODORE 8K WANTED for Vic20, any reasonable price considered. Tel: 0442 67150 (after 6 pm).

DRAGON USER seeks experienced Dragon user, North London area. Tel: (Mario) 01-809 3032 (evenings).

WANTED: ZX printer paper, will pay cash or swap for cassettes. Tel: 0302 722669 (ask for Nick Mottram).

WANTED: BBC Model A. Will pay £200. Tel: York 797766, evenings.

WANTED: Intellivoice module, pay £25. Tel: 01-274 9010 (5 pm to 7 pm).

SPECIALLY FOR THE DRAGON USER 2 books from Sunshine

Dragon Games Master is a carefully structured book about writing games programs. All major aspects of interactive computer games are considered as you learn how to handle sound, colour, graphics, movement, mazes, detection, decisions, responses, consequences, scoring systems, status displays, economics, skill levels, title sequences and instructions. You will learn how to include these features in all your own games. The book takes you through each step line by line from writing the simplest games right through to the design and construction of first class adventure programs which rival commercial software in their complexity and presentation. (160pp) £5.95

Dragon 32 Games Master

NEW
RELEASE

The Working Dragon 32

The Working Dragon is the book for those of you who dream of putting your computer to some practical use. It is based on a collection of solid, sophisticated programs in areas such as data storage, finance, graphics, household management, education and games of skill. Some of the more advanced programs include a Text Editor, which can perform many of the functions of a word processor, and Music Editor, which will let you write long music programs without endlessly repeating similar routines. Each of the programs is explained in detail, line by line. And each of the programs is built up out of general purpose

subroutines which, once understood, can form the basis of any other programs you need to write. Advanced programming skills spring out of the discussion explaining each subroutine. The collection also leaves you with a wide range of practical application programs which might otherwise only be available on cassette. (160pp) £5.95

SUNSHINE

QUITE SIMPLY THE BEST

NEW RELEASES

FUN PALACE

Captain Lasersound has invited me to join him on a journey to the Fun Palace of the Universe.

He has a sensational collection of mind warping games available, created to stretch the barriers of human endeavour.

One of these is *Learn to Play Guitar*. This program uses the Spectrum's sound and graphics to teach the rudiments of guitar playing.

So that's what's happening in the electronic wonderland where only the ultimate warriors survive — I had wondered.

Program *Learn to Play Guitar*
Price £6.00
Micro Spectrum 16/48K
Supplier Lasersound
Stratford Workshops
Burford Road
London E15

LIGHT PEN

It seemed as though Psion had pretty much sewn up the 3D graphics program package with its *Vu-3D*. However, Emsoft evidently don't agree.

To design your figure, you need to know the co-ordinates of each vertex. Once created, the figure can be turned through any of three axis.

Although this program doesn't have the fill-in command of the Psion program, the 48K version does have an interesting feature — simple designs may be stored in the form of 15 screen images which can then be displayed in rapid sequence to give the illusion of movement.

Emsoft intends to produce

versions of the tape for use with the RD Digital Tracer and the DK'Tronics light pen. Anyone who buys the current version will be able to get one of the extended ones free of charge at a later date.

Program *3D Graphics*
Price £5.95
Micro Spectrum 16/48K
Supplier Emsoft
37 Lennox Drive
Wakefield
West Yorkshire

MURDER!

Worm Software has a number of programs available for the BBC. Despite the Automata-like title, the company specialises in fairly serious educational software.

Forensic uses the format of "murder cases" to test your knowledge of chemicals and their behaviour — your knowledge of chemistry and biology will enable you to eliminate suspects and find the murderer.

Program *Forensic*
Price £5
Micro BBC 32K
Supplier Worm Software
76 Hurstwood Road
New Oscott
Birmingham B23 5BY

GOLD FEVER

Gem Software is a company well known for its Dragon games. The company has entered the, as yet, untapped Lynx market with two arcade style games — *Monster Mine* and *Sultan's Maze*.

Monster Mine sets you the task of finding gold in a mons-

ter inhabited mine. The game is a mixture of machine code and Basic. You can save the high score table, so that your successes will be recorded for posterity.

Program *Monster Mine*
Price £7.95
Micro Lynx 48K
Supplier Gem Software
Unit D
The Maltings
Station Road
Sawbridgeworth
Herts

DIVIDED

Educational software for the Spectrum is booming, but very often it takes the form of teachers with limited programming knowledge creating daft programs to do what could be done better with pencil and paper.

Glendale Software has released a package entitled *Junior Maths* which teaches addition, subtraction, multiplication and division. It claims that the computer is used to the full, with high-resolution and sound, used to convey the educational message.

Program *Junior Maths*
Price £4.50
Micro Spectrum 16/48K
Supplier Glendale Software
27 Glendale Avenue
Eastbourne
East Sussex BN21 1UT

DOOMED!

The Sharp machines don't get much of a mention in these pages — mainly because we are never sent anything.

To prove that we have nothing against Japanese machines, we shall examine *Encounter* from Solo Software, a company offering nothing but software for the Sharp MZ80K or MZ80A.

Encounter is an adventure game that sets you the task of rescuing a young maiden who has been held captive in the house of Doom. To achieve your task you will have to deal with vicious thugs, guard dogs and the alarm system.

Program *Encounter*
Price £9.95
Micro MZ80K/A

Supplier Solo Software
51 Broad Street
Worcester WR1 3LR

REAL TIME

Moonlander is a fairly comprehensive version of *Lunar Lander* for the ZX81. Each landing will be slightly different, depending on factors like orbit height, fuel, etc.

Orion says that its program is based on realtime algorithms, so that it is a genuine test of pilot skill. Spectacular graphics are promised if you fail and crash.

Program *Moonlander*
Price £4.95
Micro ZX81 16K
Supplier Orion
Pippbrook Mill
London Road
Dorking
Surrey RH14 1JE

HUNTED ALIEN

Micromega may be a familiar name because of a recent spate of colour Spectrum advertisements from this company.

However, it also produces a range of ZX81 programs which run in 1K. Its *Arcade Action* pack contains four games all in 1K and all written in machine code.

Games include *Greedy Gobbler*, *Overtaker* and *Extra Terrestrial* in which you are the hunted alien.

Program *Arcade Action*
Price £4.95
Micro ZX81
Supplier Micromega
Quantec Systems &
Software
230-236 Lavender Hill
London SW11 1LE

NEW RELEASES

HI-RES

Another version of *Space Invaders*, are these people kidding? Well no — Odyssey was another version of *Space Invaders* for the ZX81, but it is different.

The program uses a software only technique to create a high resolution 224 by 248 pixel display, which means that the *Invaders* look more like strange intergalactic creatures and less like "K's" or "O's".

The machine code program has all the usual features, including a two-player option in which two people play at the same time — the perfect re-

cipe for bruised fingers and broken friendships I should think.

Program *Invaders*
Price £4.95
Micro ZX81 (16K)
Supplier Odyssey Computing
28 Bingham Road
Sherwood
Nottingham
NG5 2EP

OVERCOME

Empire is a game of world domination in which you try to defend the world from the Dragon Empire.

The world is divided up into 39 territories. You choose the 13 you want to control and distribute your armies amongst the territories — the computer will do the same. Battle then commences as you attempt to gain territory and rule the world.

The game features hi-res graphic displays and machine code. Pessimists will find themselves well catered for since, if you do nothing, the blurb invites you to "sit back and watch the world being overwhelmed". Oh well, it beats breakfast TV anyway.

Program *Empire*
Price £6.95

Micro Dragon 32
Supplier Shards Software
189 Eton Road
Ilford
Essex IG1 2UG

FUN GAME

Headfield Technology is a new software house intending to specialise on the Oric.

It's first release is *Mastermynde* — this is very much true to tradition, since it has been the first release of something like 10,000 different software houses.

The game is for 1 to 4 players and there is an optional timer facility so that you have to decide quickly.

What do you mean "What's the game like?" Look, I'm not going to explain mastermind again. No. Definitely not.

In *Mastermynde* you have to guess a sequence of colours. The computer will tell you after each guess how many colours you have right and how many places — it's a fun game for all the family. Was that all right?

Program *Mastermynde*
Price £4.95
Micro Oric 16/48K
Supplier Headfield Technology
Lock Street
Saville Town
Dewsbury
WF17 9BW

HYPNOTIC

I've always thought that *Life* was a pretty pretentious title for a computer simulation that should really be called "pretty blobs making patterns". Versions of *Life* abound, but *Life-plus* is the first I've seen for the BBC.

The makers of this version have obviously recognised that the appeal of the game lies in the hypnotic patterns that are formed by the dying and living cells (or whatever they are supposed to be), rather than its spurious educational content. Thus, *Life-plus* features animation and turtle graphics, as well as eight colour screens.

Program *Life-plus*
Price £4.49
Micro BBC A or B
Supplier Mayday Software
181 Portland Crescent
Stanmore
Middx HA7 1LR

INVADERS

It is possible that there are three or four people in the world who own a Vic20, but do not own a copy of *Space Invaders*. Those people have now had the number of different software houses from which they can buy a copy increased by one.

Swift Software has begun its career as a software house by releasing two programs, *Invaders From Outer Space* and *Disasteroids*; ie, *Space Invaders* and *Asteroids*.

Both games are for the unexpanded machine and are available together at £8.95.

Program *Invaders From Outer Space*
Price £4.95
Micro Vic20
Supplier Swift Software
75 Broadgate Lane
Horsforth
Leeds

STARRED

Peacock Software has found a market area that no one else seems to have tapped — using your computer to tell your fortune.

The Oracle for the ZX81 does exactly that, thanks to Valerie Graham, a palmist who helped develop the program.

A Spectrum version is expected soon.

Program *The Oracle*
Price £5.50

LOSERS

If only my eyes weren't running, then I could see the screen.

POLLEN COUNT PROGRAM

Ziggurat

Full of fables

It is very true — and will receive universal acclaim — that most microcomputer software (and especially games) is well nigh fabulous.

Dr Samuel Johnston, in his Dictionary published in 1755, gives the following definition of fabulous: feigned; full of fables, or invented tales.

And this is the sense in which I use the term.

Most computer games bear little relationship to either their packaging, or their verbal description.

I used to recommend people to buy computer software from shops, and to steer clear — as much as possible — of software by post.

Having been told, and having found out for myself by asking, that many so-called computer shops will not allow users to try out software before they buy it — the "Sorry, we have to sell the package unopened" excuse — the game has changed.

The reason I used to recommend the buying of software from shops, rather than by post, was because it was always possible to try out the software prior to purchase. Any shop worthy of the name should enable the potential purchaser to try out software before expecting the poor person to buy it.

When you buy merchandise from one of the chain stores (such as M&S or BHS) you can be reasonably sure that the description which is associated with the merchandise is fairly accurate. For how many games is that true? How many times have games been bought which promise one thing, often with magnificent graphics, yet turn out to be something else altogether more mundane?

The reason why software stores do not offer a 'trial' period after purchase during which unsatisfactory — or unsatisfying — programs can be returned and exchanged for others is piracy.

Such a system would allow programs to be continually copied and exchanged for others.

It is interesting to consider why software piracy is so rife — are computer users really that despicable? Or is it that the prices charged for software are unreasonable?

There seems to be an assumption that if a person is interested in computing, they are legitimate targets for a rip-off. Many (well, not all that many) are making their fortunes by selling software at prices with a mark-up into the 1000s of percent.

Would people be so keen to copy software wholesale if all the prices were more reasonable? After all, it still costs the price of a blank tape to take even an audio copy, and often the copy is poor and prone to fail.

In no way am I suggesting that illegal copying of programs is admissible, but I do suggest that the problem is largely one which could be lessened by prices coming down. If a program was sold at £2, would it not then be less trouble to pay the £1.50 more than the cost of a blank cassette than going through the hassle of making a home copy?

In my view, software prices should be substantially reduced.

And the over-pricing does not end with software. It runs through the whole industry. To the machines themselves — look at the price-cutting now taking place in the US — to those selling add-ons, books and all manner of support. Even to inflated attendance fees at conferences and workshops and club membership fees.

So, back to software. I don't think it is fair for many software suppliers to complain of piracy when they do not act fairly themselves.

More often than not it is the users who are getting ripped-off — not the software houses. We should hear less about piracy and more about the rights of the user.

Ever since it was found that some people were willing to wait amazing (fabulous, even) numbers of months for their mail-order computers, the user has been regarded as easy prey. The law of copyright may not be too clear, but neither is the fair trading legislation concerning the promises made about programs.

Have you ever played a four-dimensional computer game as an android on an alien planet. And if you did, was it a duel of life-and-death with your pulse trembling and your palms unpleasantly sweaty on the controls?

Boris Allan

Puzzle

Royal visit

Puzzle No 64

There was great excitement at the prospect of the Royal Visit to Winsorville, South Carolina.

It had been arranged for all the schools in the town to combine to form a marching display, followed by a tour of inspection by the Royal Party.

For this, the children were to be arranged in a 'square' formation, with as many children to the rows as there were rows. And (coincidentally!) it so happened that there was exactly the right number present for this to be possible.

When the day of the Visit arrived it was found that no one had taken account of the 312 teachers and ancillary staff, who, of course, should also take a place. To the surprise of all, except readers of this puzzle, it was possible to incorporate these extras without affecting the 'square' arrangement — though, of course, the resulting square was a little larger in size.

How many children were there and what were the dimensions of the square (in people) before and after the addition of the extra teachers? There may be more than one possible answer but one seems the more likely.

Solution to Puzzle No 59

The following program does the trick:

```
10 LET N = INT ((50500 * 0.99) + 0.5)
20 FOR X = 1 TO N/157
30 LET Y = (N-X*157)/187
40 IF Y = INT (Y + 0.5) THEN PRINT "No of standard
Woltzits: " X, "No of de-luxe Woltzits: " Y
50 NEXT X
```

Line 10 finds the number of screws actually used, N. X is the number of standard Woltzits and Y is the number of de-luxe Woltzits. For each number of standard Woltzits from X=1 upwards until all the screws are used up (X=N/157) the number of remaining screws is tested to see if it makes a complete number, Y, of de-luxe Woltzits. If it does then Line 40 prints the solution.

There are two solutions: 110 Standard/175 De-luxe and 297 Standard/18 De-luxe.

Winner of Puzzle No 59

The winner is: C E Deer, Gainsborough Road, Felixstowe, Suffolk, who receives £10.

enquiries are welcomed.

please leave blank:
DESPATCH NUMBER.....

Automonopoli mystery! Why has the name changed to GO TO JAIL

READ "THE PIMAN DIARIES"...

ON NEXT WEEK'S BACK PAGE,
FOR THE (hic) appalling truth!

SPOT THE DIFFERENCE COMPETITION

THE CORRECT
ANSWERS WERE

DIFFERENCE	IMPORTANCE
A Giving back to our public as much as we can. (Yes that's a free jazz band on our stand. Wow a saxophone is this a clue)	2
B Automata is committed to non-violent games. No killing, no conquering, no bombing..... Just First Class entertainment.	1
C These back-page advertisements are rather silly, and "ay well get sillier. Don't we care about making pots of money?"	4
D There are eleven-thousand red orangr outangs in Balkan dance costumes, just outside of camera range. Honest there are.....	8
E There are no computers on our exhibition stand. Our games' reputations and their reviews seem to be all that's needed.	7
F We rather enjoy dressing up in bright pink combinations and Groucho Marx outfits, and then go exposing ourselves.	6
G There are a great many happy people with smiling faces in the photograph. This makes us happy too.	3
H We are pleased to meet our public face to face. We don't want to lose contact with our most important clients: you.	5

PATHETIC RESPONSE !

ONLY 21 ENTRIES ... BAH! Hic! LURCH... GET 'EM!! HEH HEH HEH...

meet the piman! we put some ting in computing
